ENGINE PERFORMANCE

Engine Controls and Fuel - 1.5L (L3A) - Description and Operation - Volt

DESCRIPTION AND OPERATION

ENGINE CONTROL MODULE DESCRIPTION

The Engine Control Module (ECM) interacts with many emission related components and systems, and monitors emission related components and systems for deterioration. OBD II diagnostics monitor the system performance and a diagnostic trouble code (DTC) sets if the system performance degrades. The ECM is part of a network and communicates with various other vehicle control modules.

Malfunction indicator lamp (MIL) operation and DTC storage are dictated by the DTC type. A DTC is ranked as a Type A or Type B if the DTC is emissions related. Type C is a non-emissions related DTC.

The ECM is the control center of the engine controls system. Review the components and wiring diagrams in order to determine which systems are controlled by the ECM.

The ECM constantly monitors the information from various sensors and other inputs, and controls the systems that affect engine performance and emissions. The ECM also performs diagnostic tests on various parts of the system and can turn on the MIL when it recognizes an operational problem that affects emissions. When the ECM detects a malfunction, the ECM stores a DTC. The condition area is identified by the particular DTC that is set. This aids the technician in making repairs.

ECM Function

The ECM can supply 5 V or 12 V to various sensors or switches. This is done through pull-up resistors to regulated power supplies within the ECM. In some cases, even an ordinary shop voltmeter will not give an accurate reading due to low input resistance. Therefore, a digital multimeter (DMM) with at least 10 megaohms input impedance is required in order to ensure accurate voltage readings.

The ECM controls the output circuits by controlling the ground or the power feed circuit through transistors or a device called an output driver module.

EEPROM

The electronically erasable programmable read only memory (EEPROM) is an integral part of the ECM. The EEPROM contains program and calibration information that the ECM needs in order to control engine operation.

Special equipment, as well as the correct program and calibration for the vehicle, are required in order to reprogram the ECM.

Data Link Connector (DLC)

The data link connector (DLC) provides serial data communication for ECM diagnosis. This connector allows the technician to use a scan tool in order to monitor various serial data parameters, and display DTC information. The DLC is located inside the driver's compartment, underneath the instrument panel.

Malfunction Indicator Lamp (MIL)

The malfunction indicator lamp (MIL) is inside the instrument panel cluster (IPC). The MIL is controlled by the ECM and illuminates when the ECM detects a condition that affects vehicle emissions.

ECM Service Precautions

The ECM, by design, can withstand normal current draws that are associated with vehicle operations. However, care must be used in order to avoid overloading any of these circuits. When testing for opens or shorts, do not ground or apply voltage to any of the ECM circuits unless the diagnostic procedure instructs you to do so. These circuits should only be tested with a DMM unless the diagnostic procedure instructs otherwise.

Emissions Diagnosis For State I/M Programs

This OBD II equipped vehicle is designed to diagnose any conditions that could lead to excessive levels of the following emissions:

- Hydrocarbons (HC)
- Carbon monoxide (CO)
- Oxides of nitrogen (NOx)
- Evaporative emission (EVAP) system losses

Should this vehicle's on-board diagnostic system (ECM) detect a condition that could result in excessive emissions, the ECM turns ON the MIL and stores a DTC that is associated with the condition.

Aftermarket (Add-On) Electrical And Vacuum Equipment

CAUTION: Do not attach add-on vacuum operated equipment to this vehicle. The use of add-on vacuum equipment may result in damage to vehicle components or systems.

CAUTION: Connect any add-on electrically operated equipment to the vehicle's electrical system at the 12 V battery (power and ground) in order to prevent damage to the vehicle.

Aftermarket, add-on, electrical and vacuum equipment is defined as any equipment installed on a vehicle after leaving the factory that connects to the vehicle's electrical or vacuum systems. No allowances have been made in the vehicle design for this type of equipment.

Add-on electrical equipment, even when installed to these strict guidelines, may still cause the powertrain system to malfunction. This may also include equipment not connected to the vehicle electrical system, such as portable telephones and radios. Therefore, the first step in diagnosing any powertrain condition is to eliminate all of the aftermarket electrical equipment from the vehicle. After this is done, if the problem still exists, the problem may be diagnosed in the normal manner.

Electrostatic Discharge (ESD) Damage

NOTE: In order to prevent possible electrostatic discharge damage to the ECM, DO NOT touch the connector pins on the ECM.

The electronic components that are used in the control systems are often designed to carry very low voltage. These electronic components are susceptible to damage caused by electrostatic discharge. Less than 100 V of static electricity can cause damage to some electronic components. By comparison, it takes as much as 4,000 V for a person to even feel a static discharge.

There are several ways for a person to become statically charged. The most common methods of charging are by friction and by induction. An example of charging by friction is a person sliding across a car seat.

Charging by induction occurs when a person with well insulated shoes stands near a highly charged object and momentarily touches ground. Charges of the same polarity are drained off leaving the person highly charged with the opposite polarity. Static charges can cause damage, therefore, it is important to use care when handling and testing electronic components.

Emissions Control Information Label

The underhood Vehicle Emissions Control Information Label contains important emission specifications. This identifies the year, the displacement of the engine in liters, and the class of the vehicle.

This label is located in the engine compartment of every General Motors vehicle. If the label has been removed, it can be ordered from GM service parts operations (GMSPO).

FUEL SYSTEM DESCRIPTION

Fuel System Overview

The fuel system is an electronic returnless on-demand design. The returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

An electric turbine style fuel pump attaches to the fuel tank fuel pump module inside the fuel tank. The fuel pump supplies fuel through the fuel filter and the fuel feed pipe to the high pressure fuel pump. The high pressure fuel pump supplies fuel to a variable-pressure fuel rail. Fuel enters the combustion chamber through precision multi-hole fuel injectors. The high pressure fuel pump, fuel rail pressure, fuel injection timing, and injection duration are controlled by the engine control module (ECM).

Electronic Returnless Fuel System

The electronic returnless fuel system is a microprocessor controlled fuel delivery system which transports fuel from the tank to the fuel rail. It functions as an electronic replacement for a traditional, mechanical fuel pressure regulator. The pressure relief regulator valve within the fuel tank provides an added measure of over-pressure protection. Desired fuel pressure is commanded by the engine control module (ECM), and transmitted to the fuel pump driver control module via a GMLAN serial data message. A fuel pressure sensor located on the fuel feed pipe provides the feedback the ECM requires for Closed Loop fuel pressure control.

Fuel Pump Driver Control Module

The fuel pump driver control module is a serviceable GMLAN module. The fuel pump driver control module receives the desired fuel pressure message from the engine control module (ECM) and controls the fuel pump located within the fuel tank to achieve the desired fuel pressure. The fuel pump driver control module sends a 25 kHz PWM signal to the fuel pump, and pump speed is changed by varying the duty cycle of this signal. Maximum current supplied to the fuel pump is 15 amps. A fuel pressure sensor located on the fuel feed pipe

provides fuel pressure feedback to the ECM.

Fuel Pressure Sensor

The fuel pressure sensor is a serviceable 5 V, 3-pin device. It is located on the fuel feed pipe forward of the fuel tank, and receives power and ground from the ECM through a vehicle wiring harness. The sensor provides a fuel pressure signal to the ECM, which is used to provide Closed Loop fuel pressure control.

Fuel Tank

The fuel tank stores the fuel supply. The fuel tank is located in the rear of the vehicle. The fuel tank is held in place by 2 metal straps that attach to the underbody of the vehicle. The fuel tank is molded from high-density polyethylene.

Fuel Fill Pipe

The fuel fill pipe has a built-in restrictor in order to prevent refueling with leaded fuel.

Fuel Tank Fuel Pump Module

The electric turbine style fuel pump attaches to the fuel tank fuel pump module inside the fuel tank and supplies fuel through the fuel feed pipe to the high pressure fuel pump. The fuel tank fuel pump module contains a reverse flow check valve. The check valve maintains fuel pressure in the fuel feed pipe in order to prevent long cranking times.

The fuel tank fuel pump module consists of the following major components:

- The fuel level sensor
- The fuel pump and reservoir assembly
- The fuel filter
- The fuel strainer
- The pressure relief regulator valve
- The jet pump

Fuel Level Sensor

The fuel level sensor consists of a float, a wire float arm, and a ceramic resistor card. The position of the float arm indicates the fuel level. The fuel level sensor contains a variable resistor which changes resistance in correspondence with the position of the float arm.

Fuel Pump

The fuel pump is mounted in the fuel tank fuel pump module reservoir. The fuel pump is an electric turbine style pump which pumps fuel to the high pressure fuel pump at a pressure that is based on feedback from the fuel feed pipe fuel pressure sensor. The fuel pump delivers a constant flow of fuel even during low fuel conditions and aggressive vehicle maneuvers. The fuel pump flex pipe acts to dampen the fuel pulses and noise generated by the fuel pump.

Fuel Filter

The fuel filter is located in the fuel tank fuel pump module. The paper filter element traps particles in the fuel

that may damage the fuel injection system. The filter housing is made to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature.

Fuel Strainer

The fuel strainer attaches to the lower end of the fuel tank fuel pump module. The fuel strainer is made of woven plastic. The functions of the fuel strainer are to filter contaminants and to wick fuel. The fuel strainer normally requires no maintenance. Fuel stoppage at this point indicates that the fuel tank contains an abnormal amount of sediment or contamination.

Jet Pump

The jet pump is located in the fuel tank fuel pump module. Fuel pump flow loss, caused by vapor expulsion in the pump inlet chamber, is diverted to the jet pump through a restrictive orifice located on the pump cover. The jet pump fills the reservoir of the fuel tank fuel pump module.

Pressure Relief Regulator Valve

The pressure relief regulator valve replaces the typical fuel pressure regulator used on a mechanical returnless fuel system. The pressure relief regulator valve is closed during normal vehicle operation. The pressure relief regulator valve is used to vent pressure during hot soaks and also functions as a fuel pressure regulator in the event of the fuel pump driver control module defaulting to 100 percent pulse width modulation (PWM) of the fuel pump. Due to variation in the fuel system pressures, the opening pressure for the pressure relief regulator valve is set higher than the pressure that is used on a mechanical returnless fuel system pressure regulator.

Nylon Fuel Pipes

WARNING: In order to reduce the risk of fire and personal injury observe the following items:

- Replace all nylon fuel pipes that are nicked, scratched or damaged during installation, do not attempt to repair the sections of the nylon fuel pipes
- Do not hammer directly on the fuel harness body clips when installing new fuel pipes. Damage to the nylon pipes may result in a fuel leak.
- Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period.
- Apply a few drops of clean engine oil to the male pipe ends before connecting fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

Nylon pipes are constructed to withstand maximum fuel system pressure, exposure to fuel additives, and changes in temperature.

Heat resistant rubber hose or corrugated plastic conduit protect the sections of the pipes that are exposed to chafing, high temperature, or vibration.

Nylon fuel pipes are somewhat flexible and can be formed around gradual turns under the vehicle. However, if nylon fuel pipes are forced into sharp bends, the pipes may kink and restrict the fuel flow. Also, once exposed to fuel, nylon pipes may become stiffer and are more likely to kink if bent too far. Take special care when working on a vehicle with nylon fuel pipes.

Quick-Connect Fittings

Quick-connect fittings provide a simplified means of installing and connecting fuel system components. The fittings consist of a unique female connector and a compatible male pipe end. O-rings, located inside the female connector, provide the fuel seal. Integral locking tabs inside the female connector hold the fittings together.

Fuel Feed Front Pipe Check Valve

The one way in-line check valve is a part of the fuel feed front pipe. The check valve is located just before the high pressure fuel pump. Fuel flows into the large end of the check valve and unseats a round check ball. Fuel then flows around the check ball and out the small end and the holes around the small end. The check ball is seated closed by a spring when the fuel pressure is very low. The spring seats the check ball and keeps the fuel from draining back when the engine is not operating in order to help prevent long cranking times. The check valve also acts as a pulse damper to help limit the high pressure fuel pump pressure pulsations from affecting the low side fuel pressure sensor located by the fuel tank.

High Pressure Fuel Pump

The high fuel pressure necessary for direct injection is supplied by the high pressure fuel pump. The pump is mounted on the rear of the engine and is driven by a four-lobe cam on the camshaft. This pump also regulates the fuel pressure using an actuator in the form of an internal solenoid-controlled valve. In order to keep the engine running efficiently under all operating conditions, the engine control module (ECM) requests pressure ranging from 2 to 15 MPa (290 to 2176 psi), depending on engine speed and load. Output drivers in the ECM provide the pump control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by closing and opening the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail. When the control solenoid is NOT powered, the pump operates at maximum flow rate. In the event of pump control failure, the high pressure system is protected by a relief valve in the pump.

Fuel Rail Assembly

The fuel rail assembly attaches to the cylinder head and distributes the high pressure fuel to the fuel injectors. The fuel rail assembly consists of the following components:

- The direct fuel injectors
- The fuel rail pressure sensor

Fuel Injectors

The fuel injection system is a high pressure, direct injection, returnless on-demand design. The fuel injectors are mounted in the cylinder head beneath the intake ports and spray fuel directly into the combustion chamber. Direct injection requires high fuel pressure due to the fuel injector's location in the combustion chamber. Fuel pressure must be higher than compression pressure requiring a high pressure fuel pump. The fuel injectors also require more electrical power due to the high fuel pressure. The ECM supplies a high voltage supply circuit and a high voltage control circuit for each fuel injector. The injector high voltage supply circuit and the high voltage

control circuit are both controlled by the ECM. The ECM energizes each fuel injector by grounding the control circuit. The ECM controls each fuel injector with 65 V. This is controlled by a boost capacitor in the ECM. During the 65 V boost phase, the capacitor is discharged through an injector, allowing for initial injector opening. The injector is then held open with 12 V.

The fuel injector assembly is an inside opening electrical magnetic injector. The injector has six precision machined holes that generate a cone shaped oval spray pattern. The fuel injector has a slim extended tip in order to allow a sufficient cooling jacket in the cylinder head.

Fuel Injection Fuel Rail Fuel Pressure Sensor

The fuel rail pressure sensor detects fuel pressure within the fuel rail. The engine control module (ECM) provides a 5 V reference voltage on the 5 V reference circuit and ground on the reference ground circuit. The ECM receives a varying signal voltage on the signal circuit. The ECM monitors the voltage on the fuel rail pressure sensor circuits. When the fuel pressure is high, the signal voltage is high. When the fuel pressure is low, the signal voltage is low.

CAMSHAFT ACTUATOR SYSTEM DESCRIPTION

Circuit/System Description

The camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust system enables the engine control module (ECM) to change camshaft timing while the engine is running. The camshaft position actuator assembly varies camshaft position in response to directional changes in oil pressure. The camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust controls the oil pressure that is applied to advance or retard the camshaft. Modifying camshaft timing under changing engine demand provides better balance between the following performance concerns:

- Engine power output
- Fuel economy
- Lower exhaust emissions

The ECM uses information from the following sensors in order to calculate the desired camshaft position:

- The engine coolant temperature (ECT) sensor
- The mass air flow (MAF) sensor
- The throttle position sensor
- The vehicle speed sensor (VSS)

Camshaft Position Actuator System Operation

The ECM operates the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust by pulse width modulation (PWM) of the solenoid coil. The higher the PWM duty cycle, the larger the change in camshaft timing. Oil pressure that is applied to the advance side of the fixed vanes will rotate the camshaft in a clockwise direction. The clockwise movement of the camshaft will advance the timing up to a maximum of 21° . When oil pressure is applied to the return side of the vanes, the camshaft will rotate counterclockwise until returning to 0° .

Oil flowing to the camshaft position actuator solenoid valve - intake and camshaft position actuator solenoid

valve - exhaust housing from the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust advance passage applies pressure to the advance side of the vane wheel in the camshaft position actuator assembly. At the same time the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust retard passage is open, allowing oil pressure to decrease on the retard side of the vane wheel. These two simultaneous actions cause the vane wheel to rotate clockwise, advancing camshaft advance timing.

When the oil flowing to the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust housing is from the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust retard passage, oil pressure is applied to the retard side of the vane wheel. Because the solenoid advance passage is open, allowing oil pressure to decrease on the advance side of the vane wheel, the camshaft position retards.

The ECM can also command the camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust to stop oil flow from both passages in order to hold the current camshaft position. The ECM is continuously comparing camshaft position sensor - intake and camshaft position sensor - exhaust input with camshaft position actuator solenoid valve - Intake and camshaft position actuator solenoid valve - exhaust input in order to monitor camshaft position and detect any system malfunctions. The following table provides camshaft phase commands for common driving conditions:

Driving Conditions	Change in Camshaft Position	Objective	Result
Idle	No change	Minimize valve overlap	Stabilize idle speed
Light engine load	Retard valve timing	Decrease valve overlap	Stable engine output
Medium engine load	Advance valve timing	Increase valve overlap	Better fuel economy with lower emissions
High RPM with heavy load	Retard valve timing	Retard intake valve closing	Improve engine output

Intake Camshaft Mid Park Lock (if Equipped)

The intake camshaft position actuator park lock solenoid valve is supplied a dedicated ground control circuit from the ECM and an ignition voltage supply circuit. The ECM operates the intake camshaft position actuator park lock solenoid valve by applying ground to the solenoid valve control circuit to control the oil flow that applies the pressure to disengage the intake camshaft actuator park pin. This allows the ECM to advance or retard the camshaft. When the ECM determines that cam phasing is not desired, it will command the camshaft to the lock position at 0° . At that stage, the ECM control circuit ground is then removed from the solenoid, oil pressure is unapplied, and the camshaft actuator park pin will re-engage preventing cam phasing. The ECM can also determine if the park pin is engaged by applying a slight amount of camshaft advance or retard to verify if movement is present.

EVAPORATIVE EMISSION CONTROL SYSTEM DESCRIPTION

EVAP System Operation

The evaporative emission (EVAP) control system limits fuel vapors from escaping into the atmosphere. Fuel tank vapors are allowed to move from the fuel tank, due to pressure in the tank, through the EVAP vapor tube, into the EVAP canister. Carbon in the canister adsorbs and stores the fuel vapors. The EVAP canister stores the fuel vapors until the engine is able to use them.

This vehicles sealed fuel system features a normally sealed fuel tank and canister to reduce canister loading during daily cycles. Different than the EVAP diagnostic hardware from conventional EVAP systems this vent solenoid valve is normally closed. This keeps the fuel vapor sealed in the fuel tank and canister. The vent solenoid valve is only open for canister purge, refueling, fuel tank pressure (FTP) sensor correlation or leak check with the EVAP leak detection pump. Additional, excessive pressure is vented through the vent hose and EVAP canister vent solenoid valve to the atmosphere at a predetermined limit. Diagnostics are performed with the propulsion system ON and OFF.

Propulsion System OFF

The engine control module (ECM) wake-up timer, which is located in the Hybrid Powertrain Control Module 2, activates the ECM at three predetermined times so that leak detection can occur. This is where the EVAP leak detection pump hardware is used. The ECM uses several tests to determine if the EVAP system is leaking or restricted. These tests execute with the engine OFF at 5, 7, or 9.5 hours after the vehicle has been shut OFF. These soak times allow the fuel temperature and pressure to be stabilized.

Propulsion System ON

EVAP purge flow, FTP sensor and EVAP leak detection pump sensor performance diagnostics are conducted.

Purge Solenoid Valve Leak Test

This vehicle does not have a purge solenoid leak test. A leaking purge solenoid will set DTCs P0442 or P0455.

Large Leak Test

This vehicle does not have an engine running version of the large leak diagnostic. The large leak diagnostic only runs when the propulsion system is not active. This is accomplished by using the EVAP leak detection pump hardware and a prior refueling event was detected.

Small Leak Test

This vehicle does not use the engine OFF natural vacuum diagnostic for small leak detection. Instead it uses the

EVAP leak detection pump hardware. This test executes when the propulsion is not active at 5, 7, or 9.5 hours after the vehicle has been shut OFF.

EVAP System Components

The EVAP system consists of the following components:

EVAP Purge Solenoid Valve

The EVAP purge solenoid valve controls the flow of vapors from the EVAP system to the intake manifold. The purge solenoid valve opens when commanded ON by the ECM. This normally closed valve is pulse width modulated (PWM) by the ECM to precisely control the flow of fuel vapor to the engine. This valve will also be opened during some portions of the EVAP testing when the engine is running, allowing engine vacuum to enter the EVAP system.

EVAP Canister

The canister is filled with carbon pellets used to adsorb and store fuel vapors. Fuel vapor is stored in the canister until the ECM determines that the vapor can be consumed in the normal combustion process.

Fuel Tank Pressure Sensor

The FTP sensor measures the difference between the pressure or vacuum in the fuel tank and outside air pressure. The ECM provides 5 V reference, ground and signal circuit to the FTP sensor. Depending on the vehicle, the sensor can be located in the vapor space on top of the fuel tank, in the vapor tube between the canister and the tank, or on the EVAP canister. The FTP sensor provides a signal voltage back to the ECM that can vary between 0.15 - 4.85 V. A high FTP sensor voltage indicates a fuel tank pressure. A low FTP sensor voltage indicates a fuel tank vacuum.

EVAP Vent Solenoid Valve

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. The EVAP vent solenoid valve is normally closed. This keeps vent fuel vapor sealed in the fuel tank and canister. The EVAP vent solenoid valve is similar to a conventional vent valve, but a conventional vent valve is normally open. This vent solenoid valve is only open for canister purge, refueling, fuel tank pressure sensor correlation or leak check with the EVAP leak detection pump.

Relief Valve

This is a mechanical pressure relieve valve that is part of the vent solenoid valve assembly. It protects the fuel tank by relieving excessive pressure or excessive vacuum that could build up in the sealed fuel tank from environmental changes.

EVAP Leak Detection Pump Assembly

The leak detection pump assembly consists of three main components. These components are integral parts of the EVAP leak detection pump assembly and are not serviceable.

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve

- EVAP leak detection pump pressure sensor

This leak detection pump assembly is used for FTP sensor correlation and leak checking the EVAP system for small and large system leaks.

- EVAP leak detection pump pressure sensor's primary purpose is to perform leak detection diagnostics. The sensor itself is diagnosed by a correlation to barometric pressure based off the MAP sensor.
- EVAP leak detection pump 0.51 mm (0.020 in) reference orifice, working in conjunction with the EVAP leak detection pump and pressure sensor. This orifice is used to establish a vacuum reference baseline for diagnosing EVAP leaks
- EVAP leak detection pump switching valve switches from a vent position to a pump position depending on the EVAP diagnostics taking place.

Fresh Air Filter

An in-line 5 micron air filter exists between the EVAP leak detection pump fresh air intake and behind the fuel tank fill door pocket to keep the pump hardware from becoming contaminated.

Vapor Recirculation Tube

A vapor path between the fuel fill pipe and the fuel tank is necessary to fully diagnose the EVAP system. It also accommodates service diagnostic procedures by allowing the entire EVAP system to be diagnosed from the either end of the system.

2.54 mm (0.100 in) Orifice in Fuel Fill Vapor Recirculation Pipe

The orifice aids refueling, onboard refueling vapor recovery (ORVR), to avoid canister overload while still allowing closed system leak detection and compliance with ORVR emissions standards.

Fuel Fill Door Lock Solenoid

Prevents fuel fill door opening prior to pressing the Refuel Request Switch.

Fuel Fill Door Position Switch

Provides input to the Hybrid Powertrain Control Module 2 to determine if the door position is open or closed.

Fuel Fill Cap, Capless if equipped

The fuel fill cap/capless fuel fill is equipped with a seal and has no relief valve.

Fuel Fill Pipe Check Valve

The check valve on the fuel fill pipe prevents spit-back during refueling.

Refuel Request Switch

NOTE: There is a 30 minute time frame for refueling to occur. If testing the EVAP system the vent solenoid valve will go back to it's normal closed state after 30 min. and refueling will become difficult.

NOTE: If more time is needed to open the fuel door a second 1 second press of the switch will be required. Or use the scan tool to command the vent solenoid open, if necessary, for additional testing.

Located in the driver's door panel, this switch when pressed for 1 second, puts the EVAP diagnostics into an abort state, opens the vent solenoid valve for refueling and releases the fuel fill door. A message will be displayed on the driver information center.

ELECTRONIC IGNITION SYSTEM DESCRIPTION

The electronic ignition system produces and controls a high-energy secondary spark. This spark is used to ignite the compressed air/fuel mixture at precisely the correct time. This provides optimal performance, fuel economy, and control of exhaust emissions. This ignition system uses an individual coil for each cylinder. The ignition coils are mounted near each cylinder with short integrated boots or high tension wires connecting the coils to the spark plugs. The driver modules within each ignition coil are commanded ON/OFF by the Engine Control Module (ECM). The ECM uses engine speed, the mass air flow (MAF) sensor signal, and position information from the crankshaft position and the camshaft position sensors to control the sequence, dwell, and timing of the spark.

The electronic ignition system consists of the following components:

Crankshaft Position Sensor

The crankshaft position sensor works in conjunction with a reluctor wheel on the crankshaft (front mounted crankshaft position sensor) or a reluctor wheel that is part of the flywheel (rear mounted crankshaft position sensor). The ECM monitors the voltage frequency on the crankshaft position sensor signal circuit. As each reluctor wheel tooth rotates past the sensor, the sensor creates a digital ON/OFF pulse. This digital signal is processed by the ECM. This creates a signature pattern that enables the ECM to determine the crankshaft position. The ECM uses the signal to determine which pair of cylinders is approaching top dead center based on the crankshaft position signal alone. The camshaft position sensor signals are used in order to determine which of these 2 cylinders is on a firing stroke, and which is on the exhaust stroke. The ECM uses this to properly synchronize the ignition system, the fuel injectors, and the knock control. This sensor is also used in order to detect misfire.

The ECM also has a dedicated replicated crankshaft position sensor signal output circuit that may be used as an input signal to other modules for monitoring engine RPM.

Camshaft Position Sensor

This engine uses a camshaft position sensor for each camshaft. The camshaft position sensor signals are a digital ON/OFF pulse and output 4 times per revolution of the camshaft. The camshaft position sensor does not directly affect the operation of the ignition system. The camshaft position sensor information is used by the ECM to determine the position of the camshaft relative to the crankshaft position. By monitoring the camshaft position and crankshaft position signals the ECM can accurately time the operation of the fuel injectors. The ECM supplies the camshaft position sensor with a 5 V reference circuit and a low reference circuit. The camshaft position sensor signals are an input to the ECM. These signals are also used to detect camshaft alignment with the crankshaft.

The ECM also has a dedicated replicated camshaft position sensor signal output circuit that may be used as an input signal to other modules for monitoring engine RPM.

Knock Sensor

The knock sensor system enables the ECM to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation, also known as spark knock. The knock sensor system uses 1 or 2 flat response 2-wire sensors. The sensor uses piezo-electric crystal technology that produces an AC voltage signal of varying amplitude and frequency based on the engine vibration or noise level. The amplitude and frequency depend upon the level of knock that the knock sensor detects. The ECM receives the knock sensor signal through the high and low signal circuits.

The ECM learns a minimum noise level, or background noise, at idle from the knock sensor and uses calibrated values for the rest of the RPM range. The ECM uses the minimum noise level to calculate a noise channel. A normal knock sensor signal will ride within the noise channel. As engine speed and load change, the noise channel upper and lower parameters will change to accommodate the normal knock sensor signal, keeping the signal within the channel. In order to determine which cylinders are knocking, the ECM only uses knock sensor signal information when each cylinder is near top dead center (TDC) of the firing stroke. If knock is present, the signal will range outside of the noise channel.

If the ECM has determined that knock is present, it will retard the ignition timing to attempt to eliminate the knock. The ECM will always try to work back to a zero compensation level, or no spark retard. An abnormal knock sensor signal will stay outside of the noise channel or will not be present. Knock sensor diagnostics are calibrated to detect faults with the knock sensor circuitry inside the ECM, the knock sensor wiring, or the knock sensor voltage output. Some diagnostics are also calibrated to detect constant noise from an outside influence such as a loose/damaged component or excessive engine mechanical noise.

Ignition Coils

Each ignition coil has an ignition voltage feed and a ground circuit. The engine control module (ECM) supplies a low reference and an ignition control (IC) circuit. Each ignition coil contains a solid state driver module. The ECM will command the IC circuit ON, which allows the current to flow through the primary coil windings. When the ECM commands the IC circuit OFF, this will interrupt current flow through the primary coil windings. The magnetic field created by the primary coil windings will collapse across the secondary coil windings, which induces a high voltage across the spark plug electrodes.

Engine Control Module (ECM)

The ECM controls all ignition system functions and constantly corrects the spark timing. The ECM monitors information from various sensor inputs that may include the following components, if applicable:

- Throttle position sensor
- Engine coolant temperature (ECT) sensor
- Mass air flow (MAF) sensors
- Intake air temperature (IAT) sensors
- Vehicle speed sensor (VSS)
- Transmission gear position or range information sensors
- Engine knock sensors
- Ambient pressure sensors (BARO)

THROTTLE ACTUATOR CONTROL (TAC) SYSTEM DESCRIPTION

Fig. 2: Throttle Actuator Control (TAC) System Description

Courtesy of GENERAL MOTORS COMPANY

Circuit/System Description

The system torque coordination is provided by the hybrid powertrain control module. The engine control module (ECM) provides the accelerator pedal interface in which the driver requests a vehicle torque. These driver requests are coordinated and arbitrated within the ECM and the final driver requested torque is sent to the hybrid powertrain control module. The hybrid powertrain control module then determines how the torque output will be distributed between the two electric motors and the engine. After the torque distribution has been determined, torque reductions are imposed based upon system interrupts that are listed below:

- Vehicle stability
- Torque security
- Component overheating protection

The final arbitrated values are distributed to the system. Torque coordination of the system depends directly upon the high voltage battery pack state of charge.

This system is a distributed control system where the system torque is controlled over a system network. The system network consists of serial data communications between the controllers listed below:

- Engine control module (ECM)
- Hybrid powertrain control module 1 and 2 (HPCM 1 and 2)
- Transmission control module (TCM)
- Electronic brake control module (EBCM)
- Accessory Power Module (APM)

The hybrid powertrain control module determines the engine speed which is based on the high voltage battery pack state of charge. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the throttle actuator motor. The throttle blade is spring loaded in both directions, and the default position is slightly open.

Modes Of Operation

Normal Mode

During the operation of the TAC system, several modes, or functions, are considered normal. The following modes may be entered during normal operations:

- Minimum pedal value - At Vehicle ON, the ECM updates the learned minimum pedal value.
- Minimum throttle position values - At Vehicle ON, the ECM updates the learned minimum throttle position value. In order to learn the minimum throttle position value, the throttle blade is moved to the closed position.
- Ice break mode - If the throttle blade is not able to reach a predetermined minimum throttle position, the ice break mode is entered. During the ice break mode, the ECM commands the maximum pulse width several times to the throttle actuator motor in the closing direction.
- Battery saver mode - After a predetermined time without engine speed, the ECM commands the battery saver mode. During the battery saver mode, the ECM disables the TAC motor control circuits, which removes the current draw used to maintain the engine speed and allows the throttle to return to the spring loaded default position.

Reduced Power Mode

When the ECM detects a condition with the TAC system, the ECM may enter a propulsion power reduced mode. Propulsion power reduced mode may cause one or more of the following conditions:

- Acceleration limiting - The ECM will continue to use the accelerator pedal for propulsion control, however, the vehicle acceleration is limited.
- Limited throttle mode - The ECM will continue to use the accelerator pedal for propulsion control, however, the propulsion power is reduced.
- Throttle default mode - The ECM will turn OFF the throttle actuator motor, and the throttle will return to the spring loaded default position.
- Forced idle mode - The ECM will ignore the accelerator pedal input.
- Engine shutdown mode - The ECM will disable fuel and de-energize the throttle actuator.

If the throttle blade becomes stuck, a DTC will set. Depending on the position of the throttle blade, the ECM may enter Engine Shutdown Mode. The ECM will disable fuel and de-energize the throttle actuator. If the condition remains present during the next ignition cycle, the ECM may disable engine cranking. Inspect the throttle body assembly for a stuck throttle blade if a throttle actuator DTC is current and the engine won't crank.

Circuit/System Description

The camshaft position actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The camshaft position actuator solenoid valves are each supplied a dedicated pulse width modulated (PWM) control circuit and low reference circuit from the ECM. The ECM operates each camshaft position actuator solenoid valve by controlling the amount of solenoid valve duty cycle to control the oil flow that applies the pressure to advance or retard the camshafts.

Conditions for Running the DTC

- The ignition voltage is greater than 11 V
- The ignition switch is in the crank or run position.
- The ECM has commanded the camshaft position actuator solenoid valve On.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Actions Taken When the DTC Sets

DTCs listed in the DTC Descriptor Category=Type A DTC - Exceptions listed below

If equipped with a turbocharger=Type A DTC

Conditions for Clearing the DTC

DTCs listed in the DTC Descriptor Category=Type B DTC - Exceptions listed below

If equipped with a turbocharger=Type A DTC

Circuit/System Verification

NOTE: If a crankshaft or camshaft position sensor DTC is set, the Camshaft Position Actuator output control will not function.

1. Ignition On/Vehicle in Service Mode.
2. Verify DTC P0335, P0336, P0340, or P0341 is not set.

- **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If the DTC is not set**

3. Engine Running.
4. Verify the scan tool parameters listed below do not display Malfunction while commanding the appropriate Camshaft Position Actuator Solenoid Valve On and Off:
 - Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status
 - Intake Camshaft Position Actuator Solenoid Valve Control Circuit Open Test Status
 - Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status
 - Intake Camshaft Position Actuator Solenoid Valve Control Circuit Low Voltage Test Status
 - Exhaust Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status
 - Intake Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

5. Verify that none of the scan tool Camshaft Position Actuator Solenoid Valve Control Circuit Test Status parameters change from OK or Not Run to Malfunction while moving the related harness/connectors of the Q6 Camshaft Position Actuator Solenoid Valves.

- **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

7. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

1. Ignition/Vehicle Off and all vehicle systems Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 2 or B and ground.

- **If 5 Ω or greater**

1. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Engine Running.

4. Verify the appropriate scan tool Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage Test Status does not display Malfunction.

- **If Malfunction is displayed**

1. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module, ignition On/Vehicle in Service Mode.

2. Test for less than 1 V between the control circuit and ground.

- If greater than 1 V, repair the short to voltage on the control circuit.

- If less than 1 V, replace the K20 Engine Control Module.

- **If Malfunction is not displayed**

5. Ignition/Vehicle Off, install a 5 A fused jumper wire between the control circuit terminal 1 or A and B+, engine Running.

6. Verify the appropriate scan tool Camshaft Position Actuator Solenoid Valve Control Circuit High Voltage

Test Status displays Malfunction.

- **If Malfunction is not displayed**

1. Ignition/Vehicle Off, remove the fused jumper, and disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the control circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If Malfunction is displayed**

7. Test or replace the Q6 Camshaft Position Actuator Solenoid Valve.

Component Testing

1. Ignition/Vehicle Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve.
2. Test for 7-12 Ω between the control terminal 1 or A and the low reference circuit terminal 2 or B.
 - **If not between 7-12 Ω**

Replace the Q6 Camshaft Position Actuator Solenoid Valve.
 - **If between 7-12 Ω**
3. Test for infinite resistance between each terminal and the Q6 Camshaft Position Actuator Solenoid Valve housing.
 - **If not infinite resistance**

Replace the Q6 Camshaft Position Actuator Solenoid Valve.
 - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Camshaft Position Actuator Solenoid Valve Replacement - Intake**
- **Camshaft Position Actuator Solenoid Valve Replacement - Exhaust**
- **Control Module References** for engine control module replacement, programming, and setup.

DTC P0011 OR P0014: INTAKE/EXHAUST CAMSHAFT POSITION SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

The camshaft position actuator system enables the engine control module (ECM) to change the timing of the camshafts while the engine is operating. The camshaft position actuator solenoid valves are each supplied a dedicated pulse width modulated (PWM) control circuit and low reference circuit from the ECM. The ECM operates each camshaft position actuator solenoid valve by controlling the amount of solenoid valve signal duty cycle to control the oil flow that applies the pressure to advance or retard the camshafts.

Conditions for Running the DTC

- DTC P0010, P0013, P2088, P2089, P2090 or P2091 is not set.
- The engine is running.
- The ignition voltage is greater than 11 V.
- The camshaft position actuator is enabled.
- The desired camshaft position variation is less than 3° for 4 s.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects a difference of greater than 8° between the camshaft position angle position and the desired camshaft position for greater than 30 s.

Action Taken When the DTC Sets

- DTCs listed in the DTC Descriptor Category=Type B DTC - Exceptions listed below

If equipped with a turbocharger=Type A DTC

- The camshaft position actuator solenoid valve - intake and camshaft position actuator solenoid valve - exhaust are commanded to the park position.

Conditions for Clearing the DTC

DTCs listed in the DTC Descriptor Category=Type B DTC - Exceptions listed below

If equipped with a turbocharger=Type A DTC

Diagnostic Aids

- A low oil level or condition may set this DTC.
- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed camshaft, camshaft actuator, or timing chain can cause this DTC to set.

Description and Operation

Camshaft Actuator System Description

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

NOTE:

- The engine oil level and the oil pressure are critical to the correct operation of the camshaft position actuator system. Verify that the engine has the correct oil level and the correct oil pressure before continuing with this diagnostic.
- The engine oil condition has a major impact on the camshaft actuator system. Debris in the oil can interfere with the camshaft position actuator solenoid and the mechanical camshaft actuator operation. Inspect for dirty or degraded crankcase oil. The engine may require an oil change. Inquire

with the customer when the last oil change was performed. You may also monitor the scan tool Engine Oil Life Remaining parameter. Advise the customer an oil change may be required.

1. Verify the engine has the proper oil condition, level, and pressure. Refer to [Oil Pressure Diagnosis and Testing](#).

- **If the oil condition, level, and oil pressure are not correct**

Repair as necessary

- **If the oil condition, level, and oil pressure are correct**

2. Verify DTC P0010, P0011, P0013, P0014, P0016, P0017, P0335, P0336, P0340, P0341, P0365, P0366, P2088, P2089, P2090 or P2091 is not set.

- **If any DTCs other than P0011 or P0014 are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If only DTC P0011 or P0014 is set**

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

2. Verify the DTC does not set.

- If the DTC sets, refer to Circuit/System Testing.
- If the DTC does not set, all OK.

- **If none of the DTCs are set**

3. All OK.

Circuit/System Testing

NOTE: You must complete the Circuit/System Verification before proceeding with Circuit/System Testing

1. Ignition/Vehicle Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve, ignition On/vehicle in Service Mode.
2. Verify a test lamp illuminates between the control circuit terminal 1 or A and ground when commanding the appropriate Camshaft Position Actuator Solenoid Valve On with a scan tool.

- **If the test lamp does not illuminate**

1. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance or short to ground in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If the test lamp illuminates**

3. Ignition/Vehicle Off.

4. Remove the appropriate Q6 Camshaft Position Actuator Solenoid Valve. Inspect the Camshaft Position Actuator Solenoid Valve and mounting area for the following conditions:

- For a torn, restricted, incorrect positioned, or missing screens at the Q6 Camshaft Position Actuator Solenoid Valve
- For engine oil leaks between the oil sealing lands of the Q6 Camshaft Position Actuator Solenoid Valve
- For oil seepage at the Q6 Camshaft Position Actuator Solenoid Valve connector

- **If a condition is found**

Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If a condition is not found**

NOTE: This step is testing the mechanical operation of the camshaft position actuator solenoid valve that set the DTC.

5. Exchange the suspected Q6 Camshaft Position Actuator Solenoid Valve with a Q6 Camshaft Position Actuator Solenoid Valve that is operating correctly.
6. Engine Running.
7. Command the appropriate camshaft position actuator from 0 degrees to 20 degrees and back to zero while observing the appropriate scan tool Intake/Exhaust Camshaft Position Variance parameters. The Intake/Exhaust Camshaft Position Variance should be less than 2 degrees in each of the commanded states.

- **If the Camshaft Position Variance parameter is greater than 2 degrees**

Replace or repair the mechanical camshaft position actuator

- **If the Camshaft Position Variance parameter is less than 2 degrees**

8. Test or replace the Q6 Camshaft Position Actuator Solenoid Valve.

Component Testing

1. Ignition/Vehicle Off, disconnect the harness connector at the appropriate Q6 Camshaft Position Actuator Solenoid Valve.

2. Test for 7 - 12 Ω between the control terminal 1 or A and the low reference terminal 2 or B.

- **If not between 7 - 12 Ω**

Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If between 7 - 12 Ω**

3. Test for infinite resistance between each terminal and the Q6 Camshaft Position Actuator Solenoid Valve housing.

- **If not infinite resistance**

Replace the Q6 Camshaft Position Actuator Solenoid Valve.

- **If infinite resistance**

4. All OK.

Repair Instructions

DTC P0016 OR P0017: CRANKSHAFT POSITION

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0016

Crankshaft Position - Intake Camshaft Position Not Plausible

DTC P0017

Crankshaft Position - Exhaust Camshaft Position Not Plausible

Circuit/System Description

The engine control module (ECM) uses the crankshaft position sensor, intake camshaft position sensor, and exhaust camshaft position sensor information to monitor the correlation between the crankshaft, intake camshaft, and exhaust camshaft position.

Conditions for Running the DTC

- DTC P0335, P0336, P0340, P0341, P0365, P0366, P0641, and P0651 are not set.
- The engine is cranking or running.
- The crankshaft and camshaft position signals are synchronized.
- The camshaft position actuator solenoid valves are in the parked position.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

The ECM detects a camshaft that is greater than 8 degrees advanced or 9 degrees retarded in relationship to the crankshaft.

Action Taken When the DTC Sets

DTCs P0016 and P0017 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0016 and P0017 are Type B DTCs.

Diagnostic Aids

- Inspect the engine for any recent engine mechanical repairs. An incorrectly installed timing chain can cause this DTC to set.
- A camshaft position actuator solenoid valve that is in the full advance or retard position can cause this DTC to set.
- The Camshaft Position Variance data parameter can be used to detect a binding camshaft position mechanical actuator which can cause this DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0010, P0013, P0335, P0336, P0340, P0341, P0365, or P0366 is not set.

- **If any of the DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If none of the DTCs are set**

3. Engine Running at normal operating temperature.
4. Verify DTC P0016 or P0017 is not set.

- **If the DTC is set**

Inspect for the following and repair as necessary:

- A Q6 Camshaft Position Actuator Solenoid Valve that is stuck in the full advance or retard position.
- The correct installation of the Q6 Camshaft Position Actuator Solenoid Valves.
- The correct installation of the B23 Camshaft Position Sensors.
- The correct installation of the B26 Crankshaft Position Sensor.
- A timing chain tensioner condition.
- An incorrectly installed timing chain.
- Excessive play in the timing chain.
- A timing chain that jumped teeth.

- A crankshaft reluctor wheel that has moved in relationship to top dead center (TDC) on the crankshaft.
 - **If the DTC is not set**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
- **If the DTC sets**
- A mechanical condition listed above still exists.
- **If the DTC does not set**
7. All OK.

Circuit/System Description

Heated oxygen sensors (HO2S) are used for fuel control and post-catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content in the exhaust stream. Each HO2S must reach operating temperature to provide an accurate voltage signal. A heating element inside each of the HO2S minimizes the time required for the sensor to reach operating temperature. Voltage is provided to the heater by an ignition voltage circuit through a fuse. With the engine running, ground is provided to the heater by the HO2S heater low control circuit, through a low side driver within the ECM. The ECM uses pulse-width modulation (PWM) to control the HO2S heater operation to maintain a specific HO2S operating temperature range.

Conditions for Running the DTC

P0030, P0031, P0032, P0036, P0037 and P0038

- The Ignition voltage is between 11 - 32 V.
- The engine speed is greater than 400 RPM.
- The DTCs run continuously when the above conditions are met for greater than 5 s.

P0053 and P0054

- DTCs P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119 or P2610 are not set.
- The Ignition voltage is less than 32 V.
- The Ignition is OFF for greater than 8 h.
- The engine is running.
- The engine coolant temperature and the intake air temperature (IAT) are within 8°C (14°F).
- The engine coolant temperature is between -30 to +255°C (-22 to +491°F).
- The DTCs run once per valid cold start-up when the above conditions are met.

P0135 and P0141

- DTCs P0116, P0117, P0118, P0119 or P0128 are not set.
- The Ignition voltage is between 10 - 32 V.
- The heated oxygen sensor heaters are at operating temperature.
- The scan tool HO2S Heater device control is not active.
- The commanded HO2S heater duty cycle is greater than 0%.
- The DTCs run twice per drive cycle when the above conditions are met for greater than 120 s.

Conditions for Setting the DTC

P0030, P0031, P0032, P0036, P0037 and P0038

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

P0053 and P0054

The ECM detects the HO2S heater is not within a specified resistance range at engine start-up.

P0135 and P0141

The ECM detects the HO2S heater current is less than 0.30 A or greater than 2.5 A for greater than 10 s.

Action Taken When the DTC Sets

DTC P0030, P0031, P0032, P0036, P0037, P0038, P0053, P0054, P0135, and P0141 are Type B DTCs.

Conditions for Clearing the DTC

DTC P0030, P0031, P0032, P0036, P0037, P0038, P0053, P0054, P0135, and P0141 are Type B DTCs.

Diagnostic Aids

- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool circuit status parameters for the component. The circuit status parameters will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.
- An open fuse in the HO2S heater circuit may be caused by the heater element in one of the sensors. The condition may not be present until the sensor operates for a period of time. If no fault is present in the heater circuit, monitor the amperage of each heater with a scan tool to determine if one of the heater elements is the cause of the open fuse. Inspect the sensor pigtail or the harness for contacting the exhaust system.

Circuit/System Verification

1. Engine running.
2. Verify the parameters listed below do not display Malfunction.
 - HO2S 1 or 2 Heater Control Circuit High Voltage Test Status
 - HO2S 1 or 2 Heater Control Circuit Open Voltage Test Status
 - HO2S 1 or 2 Heater Control Circuit Low Voltage Test Status
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**
3. Verify the scan tool HO2S 1 Heater or HO2S 2 Heater is between 0.3 - 2.4 A.

- **If not between 0.3 - 2.4 A**

Refer to Circuit/System Testing.

- **If between 0.3 - 2.4 A**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.

5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate B52 Heated Oxygen Sensor, Vehicle in Service Mode.

2. Verify that a test lamp illuminates between the ignition voltage circuit terminal 2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test all components connected to the fuse and replace as necessary.

- **If the test lamp illuminates**

3. Verify that a test lamp does not illuminate between the ignition voltage circuit terminal 2 and the control circuit terminal 1.

- **If the test lamp illuminates**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

4. Remove the test lamp.

5. Engine running, verify the scan tool HO2S 1 or 2 Heater Control Circuit Open Test Status parameter displays Malfunction.

- **If Malfunction is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module. Vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If Malfunction is displayed**

NOTE:

- **Less than 10 Ω of additional resistance on the ignition voltage circuit or control circuit may set a DTC. If there is resistance on a circuit, the driver will remain ON and the scan tool HO2S High Voltage Test Status parameter will display OK.**
- **Performing this test may set additional DTCs.**

6. Vehicle OFF, install a 3 A fused jumper wire between the control circuit terminal 1 and ground, engine running.
7. Verify the scan tool HO2S 1 or 2 Heater Control Circuit Low Voltage Test Status parameter displays Malfunction.

- **If Malfunction is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If Malfunction is displayed**

8. Test or replace the B52 Heated Oxygen Sensor.

DTC Descriptors

DTC P0089

Fuel Pressure Regulator Performance

DTC P00C6

Fuel Rail Pressure Low During Engine Cranking

DTC P228C

Fuel Pressure Regulator Control Performance - Low Pressure

DTC P228D

Fuel Pressure Regulator Control Performance - High Pressure

Circuit/System Description

The high fuel pressure necessary for direct injection is supplied by the high pressure fuel pump. The high pressure fuel pump is mounted on the rear of the engine and is driven by a four-lobe cam on the camshaft. This high pressure fuel pump also regulates the fuel pressure using an actuator in the form of an internal solenoid-controlled valve. In order to keep the engine running efficiently under all operating conditions, the engine control module (ECM) requests pressure ranging from 2 to 15 MPa (290 to 2,176 PSI), depending on engine speed and load. Output drivers in the ECM provide the high pressure fuel pump control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by opening and closing the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail. The high pressure fuel pump is normally closed and will not deliver an increase in fuel pressure when the control solenoid is NOT powered. In the event of pump control failure, the high pressure system is protected by a relief valve in the pump that prevents the pressure from exceeding 24 MPa (3,481 PSI).

The fuel rail pressure sensor provides the feedback necessary to the ECM to control the high pressure fuel pump and the fuel injectors. The sensor is diagnosed separately from the fuel pressure control system.

The ECM monitors the fuel rail pressure sensor and the high pressure fuel pump solenoid to determine if the commanded and actual pressures are within a predetermined range during engine cranking and at all times while the engine is running. The ECM also monitors the high pressure fuel pump solenoid to make sure it is operating within expected limits.

Conditions for Running the DTC

P0089, P228C, or P228D

- DTC P0016, P0017, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0335, P0336, P0340, P0341, P0365, P0366, P0627, P0628, P0629, P111E, P128A, P128B, P128F, P1682, P16E4, or P16E5 are not present.
- Battery voltage is greater than 11 V.
- The engine has been running for greater than or equal to 10 s.
- Low side fuel pressure is greater than 300 kPa (44 PSI).
- Barometric (BARO) pressure is greater than or equal to 70 kPa.

- Intake air temperature (IAT) is warmer than or equal to -10°C (14°F).
- Fuel temperature is between -10°C and $+132^{\circ}\text{C}$ (14°F and 270°F).
- Vehicle is not in a low fuel condition
- The DTCs run continuously when the above conditions are met.

P00C6

- DTC P0016, P0017, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0335, P0336, P0340, P0341, P0365, P0366, P0627, P0628, P0629, P111E, P128A, P128B, P128F, P1682, P16E4, or P16E5 are not present.
- Ignition voltage is greater than 8 V.
- Engine coolant temperature is between -42°C and $+130^{\circ}\text{C}$ (43°F and 266°F).
- Low side fuel pressure is greater than 0 kPa (0 PSI).
- Barometric (BARO) pressure is greater than or equal to 70 kPa.
- Intake air temperature (IAT) is warmer than or equal to -10°C (14°F).
- Vehicle is not in a low fuel condition
- The diagnostic runs once for each engine start.

Conditions for Setting the DTC

P0089

- The high pressure fuel pump has exceeded the control limits. This condition exists when the scan tool Fuel Rail Pressure Regulator Command parameter is 0° or greater than 92° .
- The above condition exists for 750 out of 938 counts, approximately 30 s at idle.

P00C6 Condition 1

- If the fuel rail pressure is less than the target set point before the engine is cranked, the pressure rise diagnostic is used.
- The pressure rise diagnostic will fail if the fuel rail pressure has not increased to the target set point within 9 s at -16°C (3.2°F) ECT or within 4 s if ECT is greater than 0°C (32°F).

P00C6 Condition 2

- If the fuel rail pressure is greater than the target set point before the engine is cranked, the pressure fall diagnostic is used.
- The pressure fall diagnostic will fail if the fuel rail pressure has dropped below 2 MPa (290 PSI) for 10 engine cycles if the ECT is less than -16°C (3.2°F) or 0.6 MPa (87 PSI) for 10 engine cycles if the ECT is greater than -16°C (3.2°F).

P228C

- The fuel rail pressure is 3 MPa (435 PSI) less than the desired fuel rail pressure.
- The above condition exists for 750 out of 938 counts, approximately 30 s at idle.

P228D

- The fuel rail pressure is 3 MPa (435 PSI) greater than the desired fuel rail pressure.
- The above condition exists for 750 out of 938 counts, approximately 30 s at idle.

Action Taken When the DTC Sets

- DTCs P0089 and P00C6 are Type B DTCs.
- DTCs P228C and P228D are Type A DTCs.
- A message center or an indicator displays Propulsion Power is Reduced and Service Stabilitrak.
- Scan tool control of the high pressure fuel pump is inhibited.

Conditions for Clearing the DTC

- DTCs P0089 and P00C6 are Type B DTCs.
- DTCs P228C and P228D are Type A DTCs.

Diagnostic Aids

- Any problem with the camshaft may set fuel pressure DTCs due to the location and design of the high pressure fuel pump. If camshaft position control DTCs are current or in history, a cam control issue may be the root cause.
- A faulty valve, plunger, or solenoid in the high pressure fuel pump may set a DTC. High pressure fuel pump damage will most likely be undetectable upon visual inspection.
- A restricted fuel feed pipe between the fuel feed pipe fuel pressure sensor and the high pressure fuel pump may set a DTC.
- A leaking or restricted fuel injector may set a DTC.
- A leak in the high pressure fuel system may set a DTC.
- Vapor lock may set DTC P0089.
- For DTC P00C6, park the vehicle outdoors overnight and perform a start in the morning.

Circuit/System Verification

1. Engine running.
2. Verify DTCs P0089, P00C6, P228C, and P228D are not set.
 - **If any of the DTCs are set**
Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
3. Verify the scan tool Fuel Rail Pressure Sensor parameter is approximately 1.9 - 5.0 MPa (276 - 725 PSI).
 - **If not between 1.9 - 5.0 MPa (276 - 725 PSI)**
Refer to Circuit/System Testing.
 - **If between 1.9 - 5.0 MPa (276 - 725 PSI)**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
 - **If the DTC sets**
Refer to Circuit/System Testing.
 - **If the DTC does not set**
6. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed first or misdiagnosis may result.**

1. Remove the G18 High Pressure Fuel Pump.
2. Verify the lobes on the camshaft do not have unusual wear or are worn.
 - **If the lobes have unusual wear or are worn**
Replace the Camshaft.
 - **If the lobes are OK**
3. Test or replace the G18 High Pressure Fuel Pump.

Component Testing

1. Ignition OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

NOTE: The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.

2. Test for 1.09 - 1.21 Ω at 20 $^{\circ}\text{C}$ (68 $^{\circ}\text{F}$) between the high control circuit terminal 2 and the low control circuit terminal 1.

- If not between 1.09 - 1.21 Ω

Replace the G18 High Pressure Fuel Pump.

- If between 1.09 - 1.21 Ω

3. Test for infinite resistance between each terminal and the G18 High Pressure Fuel Pump housing.

- If less than infinite resistance

Replace the G18 High Pressure Fuel Pump.

- If infinite resistance

4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Fuel Injection Pump Replacement
- Intake Camshaft Replacement

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Control	P0091, P00C9	P0090, P00C8	P0092, P00CA, P0690	-
Low Control	P0091, P00C9	P0090, P00C8	P0092, P00CA, P0690	-

Circuit/System Description

The high fuel pressure necessary for direct injection is supplied by the high pressure fuel pump. The high pressure fuel pump is mounted on the rear of the engine and is driven by a three-lobe cam on the camshaft. This high pressure fuel pump also regulates the fuel pressure using an actuator in the form of an internal solenoid-controlled valve. In order to keep the engine running efficiently under all operating conditions, the engine control module (ECM) requests pressure ranging from 2 - 15 MPa (290 - 2,176 psi), depending on engine speed and load. Output drivers in the ECM provide the pump control circuit with a 12 V pulse-width modulated (PWM) signal, which regulates fuel pressure by closing and opening the control valve at specific times during pump strokes. This effectively regulates the portion of each pump stroke that is delivered to the fuel rail.

It is important to note that the high pressure fuel pump is a trailing-edge control system, meaning that if the control solenoid is NOT powered, the pump operates at maximum flow rate. In the event of pump control failure, the high pressure system is protected by a relief valve in the pump that prevents the pressure from exceeding 17.5 MPa (2,538 psi).

NOTE: The fuel rail pressure sensor is diagnosed separately from the fuel pressure control system and should not be replaced for any codes referenced in this document.

The fuel rail fuel pressure sensor operates on a 5 V reference circuit and it provides the feedback necessary to the ECM to control the high pressure fuel pump and the fuel injectors.

Conditions for Running the DTC

- Battery voltage is greater than or equal to 11 V.
- Engine speed is greater than or equal to 50 RPM.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0090

The ECM detects an open circuit in the high pressure fuel pump actuator low control circuit for 4 s.

P0091

The ECM detects a short to ground in the high pressure fuel pump actuator low control circuit for 4 s.

P0092

The ECM detects a short to voltage in the high pressure fuel pump actuator low control circuit for 4 s.

P00C8

The ECM detects an open circuit in the high pressure fuel pump actuator high control circuit for 4 s.

P00C9

The ECM detects a short to ground in the high pressure fuel pump actuator high control circuit for 4 s.

P00CA

The ECM detects a short to voltage in the high pressure fuel pump actuator high control circuit for 4 s.

Action Taken When the DTC Sets

DTCs P0090, P0091, P0092, P00C8, P00C9, and P00CA are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0090, P0091, P0092, P00C8, P00C9, and P00CA are Type A DTCs.

Diagnostic Aids

- Before performing any circuit testing, ensure that the harness connector for the G18 High Pressure Fuel Pump is properly seated.
- Before performing any circuit testing, visually inspect the harness connector and the G18 High Pressure Fuel Pump connector for damage or bent pins.
- Circuit faults in the high pressure fuel control system may result in performance diagnostic failures, such as P0089, P00C6, P163A, P228C, or P228D. If any of the circuit DTCs referenced in this document are active, they take priority over any fuel system performance diagnostic. Always attempt to diagnose and repair circuit faults first, before reviewing other system DTCs.

 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump, Vehicle in Service Mode.
2. Verify that a test lamp does not illuminate between the high control circuit terminal 2 and ground.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the high control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
3. Verify that a test lamp does not illuminate between the low control circuit terminal 1 and ground.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the low control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
4. Verify that a test lamp does not illuminate between the high control circuit terminal 2 and B+.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the high control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
5. Verify that a test lamp does not illuminate between the low control circuit terminal 1 and B+.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the low control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**

6. Remove the test lamp, connect a 3 A fused jumper wire between the high control circuit terminal 2 and ground.
7. Engine Running.
8. Verify the Fuel Pressure Regulator High Control Circuit Low Voltage Test Status transitions from OK to Malfunction.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the fused jumper, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the high control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If Malfunction is displayed**
9. Connect a 3 A fused jumper wire between the low control circuit terminal 1 and B+.
10. Verify the Fuel Pressure Regulator Control Circuit High Voltage Test Status transitions from OK to Malfunction.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the fused jumper, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If Malfunction is displayed**
11. Test or replace the G18 High Pressure Fuel Pump.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

NOTE: The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.

2. Test for 1.09 - 1.21 Ω at 20 $^{\circ}\text{C}$ (68 $^{\circ}\text{F}$) between the high control circuit terminal 2 and the low control circuit terminal 1.
 - **If not between 1.09 - 1.21 Ω**

Replace the G18 High Pressure Fuel Pump.
 - **If between 1.09 - 1.21 Ω**
3. Test for infinite resistance between each terminal and the G18 High Pressure Fuel Pump housing.
 - **If less than infinite resistance**

Replace the G18 High Pressure Fuel Pump.
 - **If infinite resistance**

4. All OK.

Circuit/System Description

The intake air temperature (IAT) sensor 1 is a variable resistor that measures the temperature of the air in the sensor bore. The engine control module (ECM) supplies 5 V to the IAT sensor 1 signal circuit and a ground for the IAT sensor 1 low reference circuit. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F).

The IAT sensor 2 produces a frequency signal, based on the inlet air temperature, which is equal to the humidity present within the sensor bore. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F) and Hertz (Hz) and the relative humidity is displayed in percent (%). The ECM supplies a regulated voltage to the signal circuit. The signal circuit is shared by the IAT sensor 2 and the humidity sensor. Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- IAT sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	10 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTCs

P0096 and P0111

- DTCs P0097, P0098, P0112, P0113, P0114, P0117, P00F4, P00F5, P00F6, P0118, P0119, or P1682 are not set.
- The vehicle has been OFF at least 8 hours.
- Ignition voltage is at least 11 V.
- The DTCs run once per ignition cycle when the conditions above are met.

Conditions for Setting the DTCs

P0096

- The ECM determines the absolute difference between IAT sensor 1 start-up temperature and the IAT sensor 2 start-up temperature is greater than 25Â°C (45Â°F).

AND

- The absolute difference between ECT start-up temperature and the IAT sensor 2 start-up temperature is greater or equal to the absolute difference between ECT start-up temperature and the IAT sensor 1 start-up temperature.
- The DTCs run once per ignition cycle when the conditions above are met.

P0111

- The ECM determines the absolute difference between IAT sensor 1 start-up temperature and the IAT sensor 2 start-up temperature is greater than 25Â°C (45Â°F).

AND

- The absolute difference between ECT start-up temperature and the IAT sensor 1 start-up temperature is greater or equal to the absolute difference between ECT start-up temperature and the IAT 2 start-up temperature.
- The DTCs run once per ignition cycle when the conditions above are met.

Action Taken When the DTC Sets

- DTC P0096 is a Type B DTC.
- DTC P0111 is a Type B DTC.
- The ECM commands the cooling fans ON.

Conditions for Clearing the DTCs

- DTC P0096 is a Type B DTC.
- DTC P0111 is a Type B DTC.

Diagnostic Aids

The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are also Humidity Sensor DTCs, check for a circuit problem.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to Special Tools (Diagnostic Tools) Special Tools (Repair Tools) .

Circuit/System Verification

1. Vehicle in Service Mode
2. Verify that DTC P0097, P0098, P0099, P00F4, P00F5, P00F6, P0102, P0103, P0112, P0113, P0114, P0641, P0651, P0697, P06A3 or P06D2 is not set.

- **If any of the DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

- **If none of the DTCs are set**

NOTE: To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 3 and 4 of this verification procedure only if the ignition has been OFF for 8 hours or more.

3. Verify the following scan tool parameters are within 30Â°C (54Â°F) of each other.

- Start-Up IAT Sensor 1
- IAT Sensor 2
- **If not within 30Â°C (54Â°F)**

Refer to Circuit/System Testing.

- **If within 30Â°C (54Â°F)**

4. Vehicle ON, verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).

- IAT Sensor 1
- IAT Sensor 2
- **If not between: -38 and +149Â°C (-36 and +300Â°F)**

Refer to Circuit/System Testing.

- **If between: -38 and +149Â°C (-36 and +300Â°F)**

5. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
6. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Check the integrity of the entire air induction system and verify that none of the following conditions exist:

- A restricted or collapsed air intake duct
- An intake manifold leak
- A misaligned or damaged air intake duct
- Any water intrusion in the induction system
- **If a condition exists**

Repair or replace component as necessary.

- **If no condition exists**

2. Vehicle OFF, and all vehicle systems OFF, it may take up to 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.

3. Test for less than 5 Ω between the low reference circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω replace the K20 Engine Control Module.

- **If less than 5 Ω**

4. Vehicle OFF, all vehicle systems OFF, test for less than 5 Ω between the ground circuit terminal 7 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

5. Vehicle in Service Mode.

6. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for less than 2 Ω in the ignition voltage circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
1. Vehicle OFF, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.
2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
- **If a test lamp illuminates**
7. Vehicle in Service Mode.
8. Verify the scan tool Intake Air Temperature Sensor 1 parameter is colder than -39°C (-38°F).
 - **If warmer than -39°C (-38°F).**
 - 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 - 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If colder than -39°C (-38°F).**
9. Vehicle OFF, install a 3 A fused jumper wire between the IAT 1 signal circuit terminal 1 and the low reference circuit terminal 3, vehicle in Service Mode.
10. Verify the scan tool Intake Air Temperature Sensor 1 parameter is warmer than 148°C (298°F).
 - **If colder than 148°C (298°F).**
 - 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 - 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If warmer than 148°C (298°F).**
11. Vehicle in Service Mode.

NOTE: The intake air temperature sensor 2 signal circuit is pulled up with low current voltage within the controller. Normally, a voltage near B+ can be measured on the circuit with a DMM, but the current will not be high enough to illuminate a test lamp.

12. Verify the scan tool Intake Air Humidity Sensor parameter is less than 1%.

- **If 1% or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the IAT 2 signal circuit terminal 8 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K20 Engine Control Module.

- **If less than 1%**

13. Vehicle OFF, install a 3 A fused jumper wire between the IAT 2 signal circuit terminal 8 and the low reference circuit terminal 3, vehicle in Service Mode.

14. Verify the scan tool Intake Air Humidity Sensor parameter is greater than 99%.

- **If 99% or less**

NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

1. Vehicle OFF, remove the jumper wire and disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the IAT 2 signal circuit terminal 8 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V.

3. Vehicle OFF.

4. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 99%**

15. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air Sensor.

2. Connect a DMM between the IAT sensor 1 signal terminal 1 and the low reference terminal 3

NOTE: A thermometer can be used to test the sensor off the vehicle.

3. Test the IAT sensor 1 by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi sensor) table for Hitachi Sensors. The resistance values should be in range of the table values.

- **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.

- **If within the specified range**

4. All OK.

Multifunction Intake Air Sensor

1. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.

- **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.

- **If within the specified range**

2. All OK.

Testing with EL-38522-A

NOTE: In-correct diagnosis will result if Circuit/System Testing is not completed before performing the following test.

1. Perform the following test using a **EL-38522-A** Variable Signal Generator or equivalent, if available.
2. Vehicle OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
 1. Red lead to the signal circuit terminal 8 at the harness connector
 2. Black leads to ground
 3. Battery voltage supply lead to B+
3. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
 - Signal switch to 5 V
 - Duty Cycle switch to 50 % (Normal)
 - Frequency switch to 250 Hz
4. Vehicle in Service Mode.
5. Verify the scan tool IAT Sensor 2 parameters listed below are within the ranges listed below:
 - IAT Sensor 2 is between 248 - 252 Hz

NOTE: Changing the frequency should cause a warmer or colder IAT 2 temperature.

- IAT Sensor 2 is between 70 - 76Â°C (160 - 166Â°F)

NOTE: Increasing or decreasing the duty cycle should have an inverse affect on humidity.

- Intake Air Humidity Sensor is between 48 - 52%
- **If a parameter is not within the specified range**

Replace the K20 Engine Control Module.

- **If all the parameters are within the specified range**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Mass Airflow Sensor Replacement](#) for multifunction intake air sensor replacement
- [Control Module References](#) for engine control module replacement, programming, and setup.

DTC P0097, P0098, OR P0099: INTAKE AIR TEMPERATURE (IAT) SENSOR 2

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

Signal	100 %	0 %	0 %*
Ground	-	0 %	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

Circuit/System Description

The IAT sensor 2 produces a frequency signal, based on the inlet air temperature, which is equal to the humidity present within the sensor bore. The signal varies with inlet air temperature and is displayed by the scan tool as °C (°F) and Hertz (Hz) and the relative humidity is displayed in percent (%). The ECM supplies a regulated voltage to the signal circuit. The signal circuit is shared by the IAT sensor 2 and the humidity sensor. Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- IAT sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	45 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTCs

P0097, P0098, and P0099

- DTCs P0685, P0686, P0687, P0689, P0690 or P1682 are not set.
- The ignition is ON, or the engine is running.
- The Ignition 1 voltage is at least 11 V.
- The DTCs run continuously within the enabling conditions.

Conditions for Setting the DTCs

P0097

NOTE: The scan tool display range is between -40 and +150Â°C (-40 and +302Â°F).

The ECM detects that the IAT sensor 2 signal is less than 13 Hz, colder than -60Â°C (-76Â°F), for greater than 5 s.

P0098

The ECM detects that the IAT sensor 2 signal is greater than 390 Hz, warmer than 150Â°C (302Â°F), for greater than 5 s.

P0099

The ECM detects that the IAT sensor 2 signal is intermittent or has abruptly changed for longer than 5 s.

Action Taken When the DTC Sets

- DTCs P0097, P0098, and P0099 are Type B DTCs.
- The ECM commands the cooling fans ON.

Conditions for Clearing the MIL/DTC

- DTCs P0097, P0098, and P0099 are Type B DTCs.

Diagnostic Aids

- With the Vehicle in Service Mode, if the engine is cold, a properly functioning IAT sensor 2 will gradually increase the scan tool IAT Sensor 2 parameter. This is due to the heat that is generated by the MAF sensor heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are also Humidity Sensor DTCs, check for a circuit problem.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P00F4, P00F5, P00F6, P0102, P0103, P0641, P0651, P0697, P06A3, or P06D2 is not set.

- **If any of the DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

- **If none of the DTCs are set**

NOTE: To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 3 and 4 of this verification procedure only if the ignition has been OFF for 8 hours or more.

3. Verify the following scan tool parameters are within 30Â°C (54Â°F) of each other.
 - Start-Up IAT Sensor 1
 - IAT Sensor 2
 - **If not within 30Â°C (54Â°F)**

Refer to Circuit/System Testing.

- **If within 30Â°C (54Â°F)**

4. Engine running.

5. Verify the following scan tool parameters are between -38 and +149Â°C (-36 and +300Â°F).

- IAT Sensor 1
- IAT Sensor 2
- **If not between: -38 and +149Â°C (-36 and +300Â°F)**

Refer to Circuit System Testing.

- **If between: -38 and +149Â°C (-36 and +300Â°F)**

6. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

7. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Vehicle OFF, and all vehicle systems OFF, it may take up to 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.

2. Test for less than 5 Ω between the low reference circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Test for less than 5 Ω between the ground circuit terminal 7 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

4. Vehicle in Service Mode, verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for less than 2 Ω in the ignition voltage circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

NOTE: The ignition circuit may supply voltage to other components. Make sure to test all circuits and components for a short to ground that share the ignition circuit.

1. Vehicle OFF, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.
 2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
- **If a test lamp illuminates**

NOTE: The intake air temperature sensor 2 signal circuit is pulled up with low current voltage within the controller. Normally, a voltage near B+ can be measured on the circuit with a DMM, but the current will not be high enough to illuminate a test lamp.

5. Verify the scan tool Intake Air Humidity Sensor parameter is less than 1%.

- **If 1% or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the IAT 2 signal circuit terminal 8 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If less than 1%**

6. Vehicle OFF, install a 3 A fused jumper wire between the IAT 2 signal circuit terminal 8 and the low reference circuit terminal 3, vehicle in Service Mode.
7. Verify the scan tool Intake Air Humidity Sensor parameter is greater than 99%.
 - **If 99% or less**

NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

1. Vehicle OFF, remove the jumper wire and disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the IAT 2 signal circuit terminal 8 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V.
3. Vehicle OFF.
 4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 99%**

8. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.
 - **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.
 - **If within the specified range**
3. All OK.

Testing with EL-38522-A

NOTE: In-correct diagnosis will result if Circuit/System Testing is not completed before performing the following test.

1. Perform the following test using a **EL-38522-A** Variable Signal Generator or equivalent, if available.
2. Vehicle OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
 1. Red lead to the signal circuit terminal 8 at the harness connector
 2. Black leads to ground
 3. Battery voltage supply lead to B+
3. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
 - Signal switch to 5 V
 - Duty Cycle switch to 50 % (Normal)
 - Frequency switch to 250 Hz
4. Vehicle in Service Mode, verify the scan tool IAT Sensor 2 parameters listed below are within the ranges listed below:
 - IAT Sensor 2 is between 248 - 252 Hz

NOTE: Changing the frequency should cause a warmer or colder IAT 2 temperature.

- IAT Sensor 2 is between 70 - 76Â°C (160 - 166Â°F)

NOTE: Increasing or decreasing the duty cycle should have an inverse affect on humidity.

- Intake Air Humidity Sensor is between 48 - 52%
- **If a parameter is not within the specified range**

Replace the K20 Engine Control Module.

- **If all the parameters are within the specified range**

5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Mass Airflow Sensor Replacement](#) for multifunction intake air sensor replacement
- [Control Module References](#) for engine control module replacement, programming, and setup.

DTC P00C7: INTAKE AIR PRESSURE MEASUREMENT SYSTEM - MULTIPLE SENSORS NOT PLAUSIBLE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P00C7

Intake Air Pressure Measurement System - Multiple Sensors Not Plausible

Circuit/System Description

This system consists of the following components:

- B74 Manifold Absolute Pressure Sensor
- B75C Multifunction Intake Air Sensor

This DTC sets when the control module detects an inconsistency between the pressure sensors and cannot identify which sensor failed.

Conditions for Running the DTC

- DTC P0106, P0107, P0108, P2227, P2228, P2229, P2230 = Not set
- Engine=Not Running

- Time between current ignition cycle and the last time the engine was running=Greater than 10 s
- Manifold Absolute Pressure= 50 to 115 kPa (7.2 to 16.6 PSI)
- Barometric Pressure= 50 to 115 kPa (7.2 to 16.6 PSI)

DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

Manifold Absolute Pressure & Barometric Pressure= Not within 10 kPa (1.5 PSI) of each other.

Actions Taken When the DTC Sets

DTC P00C7 is a Type B DTC.

Conditions for Clearing the DTC

DTC P00C7 is a Type B DTC.

Refer to:**Diagnostic Trouble Code (DTC) List - Vehicle**

- **If none of the DTCs are set**

3. Verify the scan tool parameter: Throttle Body Idle Air Flow Compensation=Less than 90 %

- **If 90 % or greater**

Refer to: [Throttle Body Inspection and Cleaning](#)

- **If less than 90 %**

4. Verify the following conditions do not exist:

- Loose clamps, cracks, or other damages to the intake system.
- Clogged air cleaner.
- Vacuum hoses with kinks, leaks, or improper connections.
- Leaks at the intake manifold or throttle body.
- Leaking, missing, or damaged O-ring on the components listed below:
 - B74 Manifold Absolute Pressure Sensor
 - B75C Multifunction Intake Air Sensor
- **If a condition exists**

Repair or replace as necessary.

- **If no condition exists**

5. Verify the scan tool parameter:

- BARO Sensor= [Altitude Versus Barometric Pressure](#) - The value should be within the range listed in the table.
- MAP Sensor= [Altitude Versus Barometric Pressure](#) - The value should be within the range listed in the table.
- **If not in the specified range**
- {BARO Sensor} Refer to: [DTC P2227-P2230](#) .
- {MAP Sensor} Refer to: [DTC P0106](#).
- **If in the specified range**

6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

DTC P00F4-P00F6: INTAKE AIR HUMIDITY SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Signal	100 %	0 %	0 %*
Ground	-	0 %	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

IAT Sensor 2

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: Varies with ambient temperature			
Ignition 1	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz	-

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Signal	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz	-40Â°C (-40Â°F) 10 Hz*
Ground	-	-40Â°C (-40Â°F) 10 Hz	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

Circuit/System Description

The sensors listed below are integrated within the Multifunction Intake Air sensor:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor
- BARO pressure sensor

The IAT sensor 2 produces a frequency signal, based on the inlet air temperature, which is equal to the humidity present within the sensor bore. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F) and Hertz (Hz) and the relative humidity is displayed in percent (%). The ECM supplies a regulated voltage to the signal circuit. The signal circuit is shared by the IAT sensor 2 and the intake air humidity sensor. Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- IAT sensor 2
- Humidity sensor
- MAF sensor

Conditions for Running the DTCs

P00F4, P00F5, and P00F6

- DTC P1682 is not active.
- The ignition is ON.
- The Ignition 1 voltage is at least 11 V for longer than 0.9 s.
- The DTCs run continuously within the enabling conditions.

Conditions for Setting the DTCs

P00F4

The ECM detects that the humidity sensor signal is less than or equal to 5 % for greater than 5 s.

P00F5

The ECM detects that the humidity sensor signal is greater than or equal to 95 % for greater than 5 s.

P00F6

The ECM monitors the humidity sensor signal every 0.1 s, to determine if the signal has changed more than 80%. The DTC sets when the condition exists for greater than 4 s.

Action Taken When the DTC Sets

- DTCs P00F4, P00F5, and P00F6 are Type B DTCs.

Conditions for Clearing the MIL/DTC

- DTCs P00F4, P00F5, and P00F6 are Type B DTCs.

Diagnostic Aids

- The Intake Air Humidity Signal parameter displays the measured humidity within the air intake system and may differ from atmospheric humidity measured outside the air intake system.
- With the Vehicle in Service Mode, if the engine is cold, a properly functioning humidity sensor will gradually increase the scan tool Intake Air Humidity Signal parameter. This is due to the heat that is generated by the multifunction intake air sensor heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the Intake Air Humidity parameter displays the value: 0 % or 100 %, and there are also IAT Sensor 2 DTCs, check for a circuit problem.
- With the Vehicle in Service Mode, if the engine is cold, a properly functioning IAT sensor 2 will gradually increase the scan tool IAT Sensor 2 parameter. This is due to the heat that is generated by the multifunction intake air sensor heating elements.

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to Special Tools (Diagnostic Tools) Special Tools (Repair Tools) .

Circuit/System Verification

NOTE: To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.

1. Vehicle in Service Mode.
2. Verify that DTC P0102, P0103, P0641, P0651, P0697, P06A3, or P06D2 is not set.

- **If any of the DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

- **If none of the DTCs are set**

3. Verify the following scan tool parameters are within 30Â°C (54Â°F) of each other.

- Start-Up IAT Sensor 1
- IAT Sensor 2
- **If not within 30Â°C (54Â°F)**

Refer to Circuit/System Testing.

- **If within 30Â°C (54Â°F)**

4. Engine Running.
5. Verify the scan tool Intake Air Humidity Sensor parameter is between 5 and 90 %.

- **If not between 5 and 90 %**

Refer to Circuit/System Testing.

- **If between 5 and 90 %**

6. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
 7. Verify the DTC does not set.
- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Vehicle OFF, and all vehicle systems OFF, it may take up to 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.

2. Test for less than 5 Ω between the low reference circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Test for less than 5 Ω between the ground circuit terminal 7 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

4. Vehicle in Service Mode.

5. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.

2. Test for less than 2 Ω in the ignition voltage circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

NOTE: The ignition circuit may supply voltage to other components. Make sure to test all circuits and components for a short to ground that share the ignition circuit.

1. Vehicle OFF, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.

2. Test for infinite resistance between the ignition voltage circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
- **If a test lamp illuminates**

NOTE: The intake air temperature sensor 2 signal circuit is pulled up with low current voltage within the controller. Normally, a voltage near B+ can be measured on the circuit with a DMM, but the current will not be high enough to illuminate a test lamp.

6. Verify the scan tool Intake Air Humidity Sensor parameter is less than 1%.

- **If 1% or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the IAT 2 signal circuit terminal 8 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If less than 1%**

7. Vehicle OFF, connect a 3 A fused jumper wire between the IAT 2 signal circuit terminal 8 and the low reference circuit terminal 3, vehicle in Service Mode.

8. Verify the scan tool Intake Air Humidity Sensor parameter is greater than 99%.

- **If 99% or less**

NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

1. Vehicle OFF, remove the jumper wire and disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the IAT 2 signal circuit terminal 8 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
3. Vehicle OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 99%**

9. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test the Intake Air Humidity Sensor by varying the air humidity in the intake duct near the sensor, while

observing the scan tool Intake Air Humidity Sensor parameter. The parameter should change and be within 5 - 95%.

- **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.

- **If within the specified range**

3. All OK.

Testing with EL-38522-A

NOTE: In-correct diagnosis will result if Circuit/System Testing is not completed before performing the following test.

1. Perform the following test using a **EL-38522-A** Variable Signal Generator or equivalent, if available.
2. Vehicle OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
 1. Red lead to the signal circuit terminal 8 at the harness connector
 2. Black leads to ground
 3. Battery voltage supply lead to B+
3. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
 - Signal switch to 5 V
 - Duty Cycle switch to 50 % (Normal)
 - Frequency switch to 250 Hz
4. Vehicle in Service Mode.
5. Verify the scan tool IAT Sensor 2 parameters listed below are within the ranges listed below:
 - IAT Sensor 2 is between 248 - 252 Hz

NOTE: Changing the frequency should cause a warmer or colder IAT 2 temperature.

- IAT Sensor 2 is between 70 - 76Â°C (160 - 166Â°F)

NOTE: Increasing or decreasing the duty cycle should have an inverse affect on humidity.

- Intake Air Humidity Sensor is between 48 - 52%
- **If a parameter is not within the specified range**

Replace the K20 Engine Control Module.

- **If all the parameters are within the specified range**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P26C9

Auxiliary Chassis Control Module Requested MIL Illumination

Circuit/System Description

Control modules constantly monitor the vehicle for any condition which may adversely affect vehicle performance. If a condition is detected, the module sets a DTC and sends a serial data message to the engine control module (ECM). The ECM sets a DTC to inform the technician that the module has set a DTC. The serial data message sent by the module also contains a request for the ECM to illuminate the malfunction indicator lamp (MIL).

The technician can observe the DTC that was set by the module by reviewing the ECM Freeze Frame records on the scan tool. The ECM Freeze Frame records also contain the engine operating conditions present when the DTC set.

Conditions for Running the DTC

- The ignition is ON or the engine is running.
- These DTCs run continuously.

Conditions for Setting the DTC

The ECM receives a serial data message from a specific module indicating that DTC has set in the module.

Action Taken When the DTC Sets

DTCs P00FF, P069E, P06EC, P0700, P0800, P0AC4, P1E00, P2561, P25A2, P25AF, P25C9, P26C8, and P26C9 are Type A DTCs.

Conditions for Clearing the MIL/DTC

DTCs P00FF, P069E, P06EC, P0700, P0800, P0AC4, P1E00, P2561, P25A2, P25AF, P25C9, P26C8, and P26C9 are Type A DTCs.

Diagnostic Aids

Communication codes, U-codes, and P-codes that set in a module can request a DTC to be set in the ECM.

Reference Information

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE:

- Do not replace the engine control module for these informational DTCs.
- Correct any engine control and communication DTCs before diagnosing these DTCs.

1. Vehicle in Service Mode.
2. Verify there are no engine control or communication DTCs set.
 - If a DTC is set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If a DTC is not set
3. Verify there are no DTCs set in any other control module.
 - If a DTC is set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If a DTC is not set
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 5. Verify the DTC does not set.
 - If the DTC sets

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If the DTC does not set
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC P0101: MASS AIR FLOW (MAF) SENSOR PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0101

Mass Air Flow (MAF) Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Ignition Voltage	P0096, P0097, P00F4, P0102, P2199	P0096, P0097, P00F4, P0102, P2199	P0102	P0096	P0101, P0103
Signal	P0102	P0102	P0102	P0102	P0101, P0103, P1101
Ground	-	P0096, P0097, P00F4, P0102, P2199	P0102	-	P0102

Circuit Description

The intake flow rationality diagnostic provides the within-range rationality check for the mass air flow (MAF), manifold absolute pressure (MAP), and the throttle position sensors. This is an explicit model-based diagnostic containing 4 separate models for the intake system.

The estimates of MAF and MAP obtained from this system of models and calculations are then compared to the actual measured values from the MAF, MAP, and the throttle position sensors and to each other to determine the appropriate DTC to fail.

Conditions for Running the DTCs

- DTC P0102, P0103, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0128, P0335, or P0336 is not set
- The engine speed is between 0 - 5, 400 RPM.
- The engine coolant temperature (ECT) is between -7 to +125Â°C (+19 to +257Â°F).
- The intake air temperature (IAT) is between -20 and +125Â°C (-4 and +257Â°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The engine control module (ECM) detects that the actual measured airflow from the MAF, MAP, and throttle position sensors is not within range of the calculated airflow that is derived from the system of models for greater than 2 s.

Action Taken When the DTC Sets

DTC P0101 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0101 is a Type B DTC.

Diagnostic Aids

- Any type of contamination on the MAF sensor heating elements will degrade the proper operation of the sensor. Certain types of contaminants act as a heat insulator, which will impair the response of the sensor to airflow changes. Water or snow can create the opposite effect, and cause the signal to increase rapidly.
- Certain aftermarket air filters may cause this DTC to set.
- Certain aftermarket air induction systems may cause this DTC to set.
- Modifications to the air induction system may cause this DTC to set.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

1. Vehicle in Service Mode.

2. Verify that DTC DTC P0641, P0651, P0697, P06A3, or P06D2 is not set.

- **If any of the DTCs are set**

Refer to [DTC P0641, P0651, P0697, P06A3, or P06D2](#) for further diagnosis.

- **If none of the DTCs are set**

3. If you were sent here from DTC P0068, P0106, P0121, or P1101; refer to Circuit/System Testing.

4. Verify the scan tool Throttle Body Idle Airflow Compensation parameter is less than 90 %.

- **90 % or greater**

Refer to [Throttle Body Inspection and Cleaning](#) .

- **If less than 90 %**

NOTE: **The Sweep Test may need to be commanded manually.**

5. Verify the scan tool Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.

- **If Disagree**

Refer to [DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135](#) for further diagnosis.

- **If Agree**

6. Determine the current vehicle testing altitude.

7. Verify the scan tool MAP Sensor pressure parameter is within the range specified in the [Altitude Versus Barometric Pressure](#) table.

- **If the MAP Sensor parameter is not in range**

Refer to [DTC P0106](#) for further diagnosis.

- **If the MAP Sensor parameter is within range**

8. Engine running, verify the scan tool MAP Sensor pressure parameter is between 26 - 52 kPa (3.8 - 7.5 PSI) and changes.

- **If not between 26 - 52 kPa (3.8 - 7.5 PSI) or does not change**

Refer to [DTC P0106](#) for further diagnosis.

- **If between 26 - 52 kPa (3.8 - 7.5 PSI) and changes**

9. Engine speed between 1, 375 and 1, 425 RPM, and at normal operating temperature.

10. Verify the scan tool MAF Sensor parameter is between 1, 800 and 2, 400 Hz.

- **If the MAF Sensor parameter is not between 1, 800 and 2, 400 Hz.**

Refer to Circuit/System Testing.

- **If the MAF Sensor parameter between 1, 800 and 2, 400 Hz.**

11. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

12. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

13. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Verify the integrity of the entire air induction system by verifying that none of the following conditions exist:

- Any damaged components
- Improperly installed components
- Collapsed, restricted, or damaged components
- Loose clamps, cracks, or other damage
- An air flow restriction
- Restricted air filter
- Splits, kinks, leaks, or improper connections at the vacuum hoses
- Vacuum leaks at the intake manifold, MAP sensor, and throttle body
- Water intrusion
- Any snow or ice buildup, in cold climates
- Contamination of the Mass Air Flow sensor element
- **If a condition is found**

Repair or replace component as necessary.

- **If no condition is found**

2. Vehicle Off, disconnect the harness connector at the B75C Multifunction Intake Air sensor.

3. Test for less than 2 Ω between the ground circuit terminal 7 and ground.

- **If 2 Ω or greater**

1. Vehicle Off.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 2 Ω**

4. Vehicle in Service Mode.

5. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle Off, remove the test lamp and remove the fuse for the ignition voltage circuit.
2. Test for less than 2 Ω in the ignition voltage circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle Off, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.
 2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
- **If a test lamp illuminates**
6. Test for 4.8 - 5.2 volts between the signal circuit terminal 6 and ground.
 - **If less than 4.8 V**
 1. Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Vehicle Off, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
7. Determine if **EL-38522-A** Variable Signal Generator or equivalent is available.
 - **EL-38522-A Variable Signal Generator; or equivalent is not available**
 1. Test or replace the B75C Multifunction Intake Air sensor.
 2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
 3. Verify the DTC does not set.
 - If the DTC sets

Replace the K20 Engine Control Module.
 - If no DTCs set
4. All OK.

- **EL-38522-A Variable Signal Generator; or equivalent is available**

8. Vehicle Off, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:

- Red lead to the signal circuit terminal 6 at the harness connector
- Black leads to ground
- Battery voltage supply lead to B+

9. Set the **EL-38522-A** Variable Signal Generator to the following specifications.

- Signal switch to 5 V
- Frequency switch to 5 kHz
- Duty Cycle switch to 50 % (Normal)

10. Engine running.

11. Verify the scan tool MAF Sensor parameter is between 4, 950 - 5, 050 Hz.

- **If not between 4, 950 - 5, 050 Hz.**

Replace the K20 Engine Control Module.

- **If between 4, 950 - 5, 050 Hz.**

12. Test or replace the B75C Multifunction Intake Air sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Mass Airflow Sensor Replacement** for multifunction intake air sensor replacement
- **Control Module References** for engine control module replacement, programming, and setup

DTC P0102 OR P0103: MASS AIR FLOW (MAF) SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Typical Scan Tool Data

MAF Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running at various operating conditions			
Parameter Normal Range: 2, 000 - 10, 000 Hz			
Ignition Voltage	0 Hz	0 Hz	-
Signal	0 Hz	0 Hz	0 Hz
Ground	-	0 Hz	-

Circuit/System Description

The mass air flow (MAF) sensor is integrated with the multifunction intake air sensor. The MAF sensor is an air flow meter that measures the amount of air in the sensor bore. The engine control module (ECM) uses the MAF sensor signal to provide the correct fuel delivery for all engine speeds and loads. A small quantity of air entering the engine indicates a deceleration or idle condition. A large quantity of air entering the engine indicates an acceleration or high load condition.

The ECM applies 5 V to the MAF sensor on the MAF sensor signal circuit. The sensor uses the voltage to produce a variable frequency signal based on the inlet air flow through the sensor bore. The signal varies with engine load and is displayed by the scan tool as Hertz (Hz) and grams per second (g/s). Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- Intake Air Temperature (IAT) sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor

- MAF sensor
- BARO pressure sensor

Conditions for Running the DTC

- The engine speed is at least 300 RPM.
- The ignition signal is at least 10 V.
- The above conditions are met for at least 1 s.
- DTC's run continuously when the above conditions are met.

Conditions for Setting the DTC

P0102

The ECM detects that the MAF Sensor signal parameter is less than 1.825 Hz (about 1.46 g/s) for at least 250 cylinder firing events.

P0103

The ECM detects that the MAF Sensor signal parameter is at least 12, 800 Hz (about 257 g/s) for at least 250 cylinder firing events.

Action Taken When the DTCs Set

DTCs P0102 and P0103 are Type B DTCs.

Conditions for Clearing the MIL/DTCs

DTCs P0102 and P0103 are Type B DTCs.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to Special Tools (Diagnostic Tools) Special Tools (Repair Tools) .

Circuit/System Verification

1. Engine idling.
2. Verify the scan tool MAF Sensor parameter is between 2.5 - 5.5 g/s.
 - **If not between 2.5 - 5.5 g/s**

Refer to Circuit/System Testing.
 - **If between 2.5 - 5.5 g/s**
3. Engine speed between 1, 375 and 1, 425 RPM, and at normal operating temperature.
4. Verify the scan tool MAF Sensor parameter is between 1, 800 and 2, 400 Hz.
 - **If the MAF Sensor parameter is not between 1, 800 and 2, 400 Hz.**

Refer to Circuit/System Testing.
 - **If the MAF Sensor parameter between 1, 800 and 2, 400 Hz.**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
7. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air sensor.
2. Test for less than 2 Ω between the ground circuit terminal 7 and ground.
 - **If 2 Ω or greater**

1. Disconnect the sensor chassis ground.
2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the chassis ground connection.
- **If less than 2 Ω**
3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.
 2. Test for less than 2 Ω in the ignition voltage circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle Off, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.
 2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition circuit, replace as necessary.
 - **If a test lamp illuminates**
5. Vehicle in Service Mode, test for 4.8 - 5.2 volts between the signal circuit terminal 6 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Vehicle in Service Mode, test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
6. Determine if EL-38522-A Variable Signal Generator or equivalent is available.
 - **EL-38522-A Variable Signal Generator; or equivalent is not available**
 1. Test or replace the B75C Multifunction Intake Air sensor.
 2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle

within the conditions that you observed from the freeze frame/failure records data.

3. Verify the DTC does not set.

- If the DTC sets

Replace the K20 Engine Control Module.

- If no DTCs set

4. All OK.

- **EL-38522-A Variable Signal Generator; or equivalent is available**

7. Vehicle OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:

- Red lead to the signal circuit terminal 6 at the harness connector
- Black leads to ground
- Battery voltage supply lead to B+

8. Set the **EL-38522-A** Variable Signal Generator to the following specifications.

- Signal switch to 5 V
- Frequency switch to 5 kHz
- Duty Cycle switch to 50 % (Normal)

9. Engine idling.

10. Verify the scan tool MAF Sensor parameter is between 4, 950 - 5, 050 Hz.

- **If not between 4, 950 - 5, 050 Hz.**

Replace the K20 Engine Control Module.

- **If between 4, 950 - 5, 050 Hz.**

11. Test or replace the B75C Multifunction Intake Air sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Mass Airflow Sensor Replacement](#) for multifunction intake air sensor replacement
- [Control Module References](#) for engine control module replacement, programming, and setup

DTC P0106: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P0106

Manifold Absolute Pressure (MAP) Sensor Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Signal	P0106, P0107	P0108	P0108	P0106
Low Reference	-	P0108	-	P0106

Typical Scan Tool Data

MAP Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: - Engine - Idling - At normal operating temperature - Accessories=Off			
Parameter Normal Range: 26 to 52 kPa (3.8 to 7.6 PSI)			
5 V Reference	0 kPa (0.0 PSI)	0 kPa (0.0 PSI)	127 kPa (18.4 PSI)
Signal	0 kPa (0.0 PSI)	127 kPa (18.4 PSI)	127 kPa (18.4 PSI)
Low Reference	-	127 kPa (18.4 PSI)	-

Circuit/System Description

Circuit	Description
5 V Reference	Regulated voltage supplied by the control module.
Signal	The control module input circuit has an internal resistance connected to 5 V.
Low Reference	Grounded through the control module.

Component	Description
B74 Manifold Absolute Pressure Sensor	The sensor is a 3-wire capacitive pressure transducer. Electronics in the sensor convert pressure into an analog voltage signal.
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.

The sensor measures the pressure in the intake manifold. The signal is used to determine the engine load. When the engine is idling or decelerating, the sensor pressure should be low. When the engine is off or under wide-open throttle conditions the pressure should be the same or close to the barometric pressure.

Conditions for Running the DTC

- DTC P0102, P0103, P0107, P0108, P010C, P010D, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0335, P0336, P0401, P0405, P0406, P042E = Not set
- Intake Air Temperature = -20 to 125Â°C (-4 to 257Â°F)
- Engine Coolant Temperature...= -20 to 125Â°C (-4 to 257Â°F)
- Engine Speed.= 500 to 8000 RPM

or

- DTC P0107, P0108, P2227, P2228, P2229, P2230, P2610 = Not set
- Ignition On - Engine Off

Frequency the DTC runs = Continuously - After the running conditions are met

Conditions for Setting the DTC

The difference between the manifold absolute pressure measured by the manifold absolute pressure sensor and a calculated value based on the throttle position exceeds the allowed range.

Actions Taken When the DTC Sets

DTCs listed in the DTC Descriptor Category=Type B

Conditions for Clearing the DTC

DTCs listed in the DTC Descriptor Category=Type B

Special Tools

EN-23738-A Vacuum Pump

Equivalent regional tools: [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#)

[Circuit/System Verification](#)

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC P0641, P0651, P0697, P06A3, P06D2 is not set.
 - **If any of the DTCs are set**

Refer to: [DTC P0641, P0651, P0697, P06A3, or P06D2](#)

- **If none of the DTCs are set**
3. If you were sent here from DTC P0101, P0121, P1101 - Refer to Circuit/System Testing.
 4. Verify the scan tool parameter:Throttle Body Idle Air Flow Compensation=Less than 90 %
 - **If 90 % or greater**

Refer to: [Throttle Body Inspection and Cleaning](#)

- **If less than 90 %**
5. Perform the scan tool control function:Throttle Sweep - Start

Verify the scan tool parameter:Throttle Position Sensors 1 and 2=Agree

- **If not the specified state**

Refer to: [DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135](#)

- **If the specified state**
6. Determine the current vehicle testing altitude.
 7. Verify the scan tool parameter:MAP Sensor=The value should be within the range listed in the table:
 [Altitude Versus Barometric Pressure](#)

- **If not in the specified range**

Refer to: Circuit/System Testing

- **If in the specified range**

8. Engine - Idling - At normal operating temperature
9. Verify the scan tool parameter:MAP Sensor= 26 to 52 kPa (3.8 to 7.6 PSI) and changes
 - **If not between 26 to 52 kPa (3.8 to 7.6 PSI) or does not change**

Refer to: Circuit/System Testing

- **If between 26 to 52 kPa (3.8 to 7.6 PSI) and changes**
10. Observe the following scan tool parameter:MAF Sensor & Engine Speed.
 11. Increase the engine speed slowly to 2000 RPM and then back to idle.
 12. Verify the scan tool parameter:MAF Sensor=The value should change smoothly and gradually as the engine speed is increased and decreased.
 - **If the value does not change smoothly and gradually**

Refer to:[**DTC P0101**](#)

- **If the value changes smoothly and gradually**
13. Verify the scan tool parameter:MAP Sensor=The value should not spike or drop out.

Perform the action while monitoring the parameter:

- Wiggle the harness and connector:B74 Manifold Absolute Pressure Sensor
- Wiggle the harness and connector:K20 Engine Control Module
- **If the value spikes or drops out**

Repair as necessary - Wiring / Terminal(s) / Electrical Connector(s)

- **If the value does not spike or drop out**
14. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 15. Verify the DTC does not set.
 - **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC is not set**
16. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle - Off
2. Verify the following conditions do not exist:
 - Collapsed or restricted intake air duct.
 - Leaking or restricted component:Exhaust System

- Leaking, missing, or damaged O-ring on the components listed below:
 - B74 Manifold Absolute Pressure Sensor
- Engine vacuum leaks.
- An engine mechanical condition. - Wear of timing chain, tensioner, or sprockets. or If one or more cylinders indicate low compression

Refer to: [Symptoms - Engine Mechanical](#)

- **If a condition exists - Repair or replace as necessary**
- **If no condition exists**

3. Disconnect the electrical connector:

4. Test for less than 10 ohms between the test points: Low Reference circuit terminal 2 & Ground

- **If 10 ohms or greater**

1. Disconnect the electrical connector: K20 Engine Control Module

2. Test for less than 2 ohms between the test points: Low Reference circuit terminal 2 @Component harness & Terminal 21 X2 @Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K20 Engine Control Module

- **If less than 10 ohms**

5. Ignition - On / Vehicle - In Service Mode

6. Test for 4.8 to 5.2 V between the test points: 5V Reference circuit terminal 1 & Low Reference circuit terminal 2

- **If less than 4.8 V**

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: K20 Engine Control Module

3. Test for infinite resistance between the test points: 5 V Reference circuit terminal 1 @Component harness & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance

4. Test for less than 2 ohms between the test points: 5 V Reference circuit terminal 1 @Component harness & Terminal 5 X2 @Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K20 Engine Control Module

- **If greater than 5.2 V**

1. Ignition/Vehicle - Off

2. Disconnect the electrical connector: K20 Engine Control Module

3. Ignition - On / Vehicle - In Service Mode

4. Test for less than 1 V between the test points: 5 V Reference circuit terminal 1 @Component harness & Ground

- If 1 V or greater - Repair the short to voltage on the circuit.

- If less than 1 V - Replace the component:K20 Engine Control Module
 - **If between 4.8 and 5.2 V**
7. Verify the scan tool parameter:MAP Sensor=Greater than 4.7 V
- **If 4.7 V or less**
 1. Ignition/Vehicle - Off
 2. Disconnect the electrical connector:K20 Engine Control Module
 3. Test for infinite resistance between the test points:Signal circuit terminal 3 @Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component:K20 Engine Control Module
 - **If greater than 4.7 V**
8. Connect a 3 A fused jumper wire between the test points:Signal circuit terminal 3 & Low Reference circuit terminal 2
9. Verify the scan tool parameter:MAP Sensor =Less than 0.2 V
- **If 0.2 V or greater**
 1. Ignition/Vehicle - OffRemove - Jumper Wire
 2. Disconnect the electrical connector:K20 Engine Control Module
 3. Ignition - On / Vehicle - In Service Mode
 4. Test for less than 1 V between the test points:Signal circuit terminal 3 @Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Ignition/Vehicle - Off
 6. Test for less than 2 ohms between the test points:Signal circuit terminal 3 @Component harness & Terminal 40 X3 @Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component:K20 Engine Control Module
 - **If less than 0.2 V**
10. Test or replace the component:B74 Manifold Absolute Pressure Sensor

Component Testing

Dynamic Test - Using Vehicle Harness

1. Ignition/Vehicle - Off
2. Remove the component:B74 Manifold Absolute Pressure Sensor - Leave the electrical connector connected.
3. Install the special tool: **EN-23738-A** Vacuum Pump @B74 Manifold Absolute Pressure Sensor
4. Use the special tool to achieve a gauge reading between -13 and -21 kPa (-0.13 and -0.21 bar, -3.8 and -6.2 in Hg).

Verify the scan tool parameter:MAP Sensor=Decreases between 13 and 21 kPa (1.8 and 3.0 PSI)

- **If the parameter does not decrease between 13 and 21 kPa (1.8 and 3.0 PSI)**

Replace the component: B74 Manifold Absolute Pressure Sensor

- **If the parameter decreases between 13 and 21 kPa (1.8 and 3.0 PSI)**

5. Use the special tool to achieve a gauge reading between -30 and -38 kPa (-0.3 and -0.38 bar, -8.8 and -11.2 in Hg).

Verify the scan tool parameter: MAP Sensor=Decreases between 30 and 38 kPa (4.4 and 5.5 PSI)

- **If the parameter does not decrease between 30 and 38 kPa (4.4 and 5.5 PSI)**

Replace the component: B74 Manifold Absolute Pressure Sensor

- **If the parameter decreases between 30 and 38 kPa (4.4 and 5.5 PSI)**

6. All OK.

Dynamic Test - Using Jumper Wires

1. Ignition/Vehicle - Off
2. Remove the component: B74 Manifold Absolute Pressure Sensor
3. Connect a 3 A fused jumper wire between the test points: 5 V Reference terminal 1 & 5 V
4. Connect a jumper wire between the test points: Low Reference terminal 2 & Ground
5. Connect a DMM between the test points: Signal terminal 3 @B74 Manifold Absolute Pressure Sensor & Ground
6. Install the special tool: EN-23738-A Vacuum Pump @B74 Manifold Absolute Pressure Sensor
7. Use the special tool to achieve a gauge reading between -55 and -47 kPa (-0.55 and -0.47 bar, -13.8 and -16.2 in Hg).

Verify the DMM displays between 0.2 and 4.9 V. - The value should not spike or drop out.

- **If not between 0.2 and 4.9 V or has spikes or drops out**

Replace the component: B74 Manifold Absolute Pressure Sensor

- **If between 0.2 and 4.9 V and there are no spikes or drops out**

8. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- [Manifold Absolute Pressure Sensor Replacement](#)
- For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC P0107 OR P0108: MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

- **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC is not set**

9. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off

2. Disconnect the electrical connector:B74 Manifold Absolute Pressure Sensor

3. Test for less than 10 ohms between the test points:Low Reference circuit terminal 2 & Ground

- **If 10 ohms or greater**

1. Disconnect the electrical connector:K20 Engine Control Module

2. Test for less than 2 ohms between the test points:Low Reference circuit terminal 2 @Component harness & Terminal 21 X2 @Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component:K20 Engine Control Module

- **If less than 10 ohms**

4. Vehicle in Service Mode.

5. Test for 4.8 to 5.2 V between the test points: 5 V Reference circuit terminal 1 & Low Reference circuit terminal 2

- **If less than 4.8 V**

1. Vehicle Off.

2. Disconnect the electrical connector:K20 Engine Control Module

3. Test for infinite resistance between the test points: 5 V Reference circuit terminal 1 @Component harness & Ground

- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance

4. Test for less than 2 ohms between the test points:5 V Reference circuit terminal 1 @Component harness & Terminal 5 X2 @Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.

- If less than 2 ohms - Replace the component:K20 Engine Control Module
- **If greater than 5.2 V**
 1. Vehicle Off.
 2. Disconnect the electrical connector:K20 Engine Control Module
 3. Vehicle in Service Mode.
 4. Test for less than 1 V between the test points: 5 V Reference circuit terminal 1 @Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V - Replace the component:K20 Engine Control Module
 - **If between 4.8 and 5.2 V**
- 6. Verify the scan tool parameter:MAP Sensor=Greater than 4.7 V
 - **If 4.7 V or less**
 1. Vehicle Off.
 2. Disconnect the electrical connector:K20 Engine Control Module
 3. Test for infinite resistance between the test points:Signal circuit terminal 3 @Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component:K20 Engine Control Module
 - **If greater than 4.7 V**
- 7. Connect a 3 A fused jumper wire between the test points:Signal circuit terminal 3 & Low Reference circuit terminal 2
- 8. Verify the scan tool parameter:MAP Sensor =Less than 0.2 V
 - **If 0.2 V or greater**
 1. Vehicle Off, remove jumper wire.
 2. Disconnect the electrical connector:K20 Engine Control Module
 3. Vehicle in Service Mode.
 4. Test for less than 1 V between the test points:Signal circuit terminal 3 @Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 5. Vehicle Off.
 6. Test for less than 2 ohms between the test points:Signal circuit terminal 3 @Component harness & Terminal 40 X3 @Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component:K20 Engine Control Module
 - **If less than 0.2 V**
- 9. Replace the component:B74 Manifold Absolute Pressure Sensor

Circuit/System Description

The intake air temperature (IAT) sensor 1 is a variable resistor that measures the temperature of the air in the sensor bore. The engine control module (ECM) supplies 5 V to the IAT sensor 1 signal circuit and a ground for the IAT sensor 1 low reference circuit. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F).

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- Mass Air Flow (MAF) sensor
- BARO pressure sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTCs

P0112, P0113, and P0114

- The ignition is ON, or the engine is running.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

NOTE: The scan tool display range is between -40 and +150Â°C (-40 and +302Â°F).

P0112

The ECM detects that the IAT sensor signal is warmer than 150Â°C (302Â°F) for at least 5 s.

P0113

The ECM detects that the IAT sensor signal is colder than -60Â°C (-76Â°F) for at least 5 s.

P0114

Where this DTC is used, the ECM detects that the IAT sensor signal is intermittent or has abruptly changed for at least 5 s.

Action Taken When the DTCs Set

- DTCs P0112, P0113, and P0114 are Type B DTCs.
- The ECM commands the cooling fans ON.

Conditions for Clearing the DTCs

DTCs P0112, P0113, and P0114 are Type B DTCs.

Diagnostic Aids

With the Vehicle in Service Mode, the engine OFF, if the engine is cold, a properly functioning IAT sensor 1 will gradually increase the scan tool IAT Sensor 1 parameter. This is due to the heat that is generated by the MAF sensor heating elements.

Circuit/System Verification

NOTE: To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 1 and 2 of this verification procedure only if the ignition has been OFF for 8 hours or more.

1. Vehicle in Service Mode.

2. Verify the following scan tool parameters are within 30Â°C (54Â°F) of each other.

- Start-Up IAT Sensor 1
- IAT Sensor 2
- **If not within 30Â°C (54Â°F)**

Refer to Circuit/System Testing.

- **If within 30Â°C (54Â°F)**

3. Engine idling.

4. Verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).

- IAT Sensor 1
- IAT Sensor 2
- **If not between: -38 and +149Â°C (-36 and +300Â°F)**

Refer to Circuit/System Testing.

- **If between: -38 and +149Â°C (-36 and +300Â°F)**

5. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

6. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Vehicle OFF, and all vehicle systems OFF, it may take up to 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.

2. Test for less than 2 Ω between the low reference circuit terminal 3 and ground.

- **If 2 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω replace the K20 engine control module.

- **If less than 2 Ω**

3. Vehicle in Service Mode, test for 4.8 - 5.2 V between the intake air temperature sensor 1 signal circuit terminal 1 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.
- **If greater than 5.2 V**

NOTE: **If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
2. Vehicle in Service Mode, test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.
- **If between 4.8 - 5.2 V**
4. Vehicle in Service Mode, verify the scan tool IAT Sensor 1 parameter is colder than -39 $^{\circ}\text{C}$ (-38 $^{\circ}\text{F}$).
 - **If warmer than -39 $^{\circ}\text{C}$ (-38 $^{\circ}\text{F}$).**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If colder than -39 $^{\circ}\text{C}$ (-38 $^{\circ}\text{F}$).**
5. Vehicle OFF, install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 3.
6. Verify the scan tool IAT Sensor 1 parameter is warmer than 148 $^{\circ}\text{C}$ (298 $^{\circ}\text{F}$).
 - **If colder than 148 $^{\circ}\text{C}$ (298 $^{\circ}\text{F}$).**
1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- If warmer than 148Â°C (298Â°F).

7. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air Sensor.

NOTE: A thermometer can be used to test the sensor off the vehicle.

2. Test resistance of the IAT sensor 1, between signal terminal 1 and the low reference terminal 3, by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance - Intake Air Temperature Sensor (Hitachi sensor) table for Hitachi Sensors. The resistance values should be in range of the table values.

- If not within the specified range

Replace the B75C Multifunction Intake Air Sensor.

- If within the specified range

3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Mass Airflow Sensor Replacement for multifunction intake air sensor replacement
- Control Module References for engine control module replacement, programming, and setup.

DTC P0117, P0118, OR P0119: ENGINE COOLANT TEMPERATURE (ECT) SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0117

Engine Coolant Temperature (ECT) Sensor Circuit Low Voltage

DTC P0118

Engine Coolant Temperature (ECT) Sensor Circuit High Voltage

DTC P0119

Engine Coolant Temperature (ECT) Sensor Circuit Intermittent

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal Circuit	P0117	P0118	P0118*	P0116, P0119, P0128
Low Reference	-	P0118	-	P0119, P0128
*ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

ECT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: -39 to 149Â°C (-38 to 300Â°F)			
ECT Sensor	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5 V to the ECT sensor signal circuit and a ground for the low reference circuit. This diagnostic checks for an open, short to ground or an intermittent circuit condition between the ECM and ECT sensor.

Conditions for Running the DTC

P0117

- Vehicle ON, or the engine is running.
- This DTC runs continuously when the above conditions are met.

P0118

- The engine run time is greater than 10 s.
- The intake air temperature (IAT) sensor is greater than 0Â°C (32Â°F).
- This DTC runs continuously when the above conditions are met.

P0119

- DTC P0117 or P0118 are not set.
- Vehicle ON, or the engine is running.
- This DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0117

The ECM detects that the ECT sensor signal is warmer than 149Â°C (300Â°F) for greater than 5 s.

P0118

The ECM detects that the ECT is colder than -39°C (-38°F) for greater than 5 s.

P0119

The ECM detects that the ECT is intermittent or has abruptly changed for greater than 4 seconds.

Action Taken When the DTC Sets

- DTCs P0117, P0118 and P0119 are Type B DTCs
- The cooling fans will be commanded ON.
- The engine is forced ON and Autostop is disabled.

Conditions for Clearing the DTC

DTCs P0117, P0118 and P0119 are Type B DTCs

Circuit/System Verification

1. Vehicle in Service Mode.

2. Verify the scan tool ECT Sensor parameter is warmer than -40°C (-40°F) and colder than 150°C (302°F) and changes with engine run time.

- **If colder than -39°C (-38°F) or warmer than 149°C (300°F) or does not change**

Refer to Circuit/System Testing.

- **If warmer than -40°C (-40°F) and colder than 150°C (302°F) and changes**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Vehicle Off and all vehicle systems OFF, disconnect the B34 Engine Coolant Temperature sensor harness connector at the sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than $5\ \Omega$ between the low reference circuit terminal 2 and ground.

- **If $5\ \Omega$ or greater**

1. Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than $2\ \Omega$ in the low reference circuit end to end.
 - If $2\ \Omega$ or greater, repair the open/high resistance in the circuit.
 - If less than $2\ \Omega$, replace the K20 Engine Control Module.

- **If less than $5\ \Omega$**

3. Vehicle in Service Mode.

4. Verify the scan tool ECT Sensor parameter is colder than -39°C (-38°F).

- **If warmer than -39°C (-38°F)**

1. Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If colder than -39°C (-38°F)**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.

6. Verify the scan tool ECT sensor parameter is warmer than 149°C (300°F).

- **If 149°C (300°F) or colder**

1. Vehicle Off, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

3. Vehicle Off.

4. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If warmer than 149 $^{\circ}$ C (300 $^{\circ}$ F)**

7. Test or replace the B34 Engine Coolant Temperature Sensor.

Component Testing

1. Vehicle Off, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.

2. Test the ECT sensor by varying the sensor temperature while measuring the sensor resistance. Compare the readings with the Temperature Versus Resistance (Engine Coolant Temperature Sensor) table. The resistance values should be in range of the table values.

- **If not within the specified range**
- Replace the B34 Engine Coolant Temperature Sensor.
- **If within the specified range**

3. Test for infinite resistance between each terminal and the sensor housing.

- **If less than infinite resistance**

Replace the B34 Engine Coolant Temperature Sensor.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Engine Coolant Temperature Sensor Replacement - Water Outlet
- Control Module References for control module replacement, programming, and setup.

DTC P0121-P0123, P0222, P0223, P16A0-P16A2, OR P2135: THROTTLE POSITION SENSOR/SENSOR COMMUNICATION CIRCUIT

Typical Scan Tool Data

Throttle Position Sensor 1

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating with the throttle closed. All accessories OFF.			
Parameter Normal Range: Throttle Position Sensor 1 3.75 - 4.75 V			
5 V Reference	5.0 V	5.0 V	5.0 V
Signal	5.0 V	0.0 V	0.0 V
Low Reference	-	0.0 V	-

Throttle Position Sensor 2

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating with the throttle closed. All accessories OFF.			
Parameter Normal Range: Throttle Position Sensor 2 0.45 - 0.90 V			
5 V Reference	0.0 V	0.0 V	0.0 V
Signal	0.0 V	5.0 V	5.0 V
Low Reference	-	5.0 V	-

Circuit/System Description

The throttle body assembly contains a contact-less inductive throttle position sensing element that is managed by a customized integrated circuit. The throttle position sensor is mounted within the throttle body assembly and is not serviceable. The engine control module (ECM) supplies the throttle body with a 5 V reference circuit, a low reference circuit, an H-bridge motor directional control circuit, and an asynchronous signal/serial data circuit. The asynchronous signal means communication is only going from the throttle body to the ECM. The throttle body cannot receive data from the ECM over the signal/serial data circuit. The throttle position sensor provides a signal voltage that changes relative to throttle blade angle. The customized integrated circuit translates the voltage based position information into serial data using the Society of Automotive Engineers (SAE) J2716 Single Edge Nibble Transmission (SENT) protocol. The throttle position sensor information is transmitted between the throttle body and the ECM on the signal/serial data circuit. The ECM decodes the serial data signal into separate voltages which are displayed on a scan tool as the voltage inputs from throttle position sensors 1 and 2.

Conditions for Running the DTC

P0121

- DTCs P0102, P0103, P0107, P0108, P0112, P0113, P0117, P0118, P0335, or P0336 is not set.
- The engine speed is between 0 - 5, 400 RPM.
- The engine coolant temperature (ECT) is -7 to +125Â°C (19 - 257Â°F).
- The intake air temperature (IAT) is -20 to +125Â°C (-4 to +257Â°F).
- The DTC runs continuously when the above conditions are met.

P0122, P0123, P0222, P0223

- DTC P06A3 is not set.
- The ignition is ON or the engine is running.
- The run/crank or powertrain relay voltage is greater than 6.41 V and reduced power is not active.
- The DTCs run continuously when the above condition are met.

P16A0, P16A1, or P16A2

- DTC P06A3 is not set.
- The ignition is ON or the engine is operating.
- The run/crank voltage is greater than 6.41 V.
- The DTCs run continuously once the above conditions are met for greater than 1 s.

P2135

- DTCs P0122, P0123, P0222, P0223, or P06A3 are not set.
- The ignition is ON or the engine is running.
- The run/crank or powertrain relay voltage is greater than 6.41 V and reduced power is not active.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0121

The ECM detects that the throttle position sensor 1 voltage is stuck within normal operating range for greater than 1 s.

P0122

The ECM detects the throttle position sensor 1 signal voltage is less than 0.32 V for greater than 1 s.

P0123

The ECM detects the throttle position sensor 1 signal voltage is greater than 4.75 V for greater than 1 s.

P0222

The ECM detects the throttle position sensor 2 signal voltage is less than 0.25 V for greater than 1 s.

P0223

The ECM detects the throttle position sensor 2 signal voltage is greater than 4.59 V for greater than 1 s.

P16A0

The ECM detects a low voltage circuit condition on the throttle position sensor signal circuit for greater than 1 s.

P16A1

The ECM detects a high voltage circuit condition on the throttle position sensor signal circuit for greater than 1 s.

P16A2

The ECM detects an incorrect message was received over the throttle position sensor signal circuit for greater

than 1 s.

P2135

The ECM detects that throttle position sensors 1 and 2 disagree greater than 7 - 10 percent for greater than 1 s.

Action Taken When the DTC Sets

- DTCs P0121 is a Type B DTC.
- DTCs P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 are Type A DTCs.
- The ECM commands the throttle actuator control (TAC) system to operate in a Reduced Engine Power mode.
- A message center or an indicator displays Reduced Engine Power.
- Under certain conditions, the ECM commands the engine OFF.

Conditions for Clearing the DTC

- DTCs P0121 is a Type B DTC.
- DTCs P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.
- If the accelerator pedal is pressed to the wide open throttle position, the throttle blade angle or Throttle Position angle is limited to less than 40 percent.

Circuit/System Verification

NOTE: If you were sent here from DTC P0068, P0101, P0106, or P1101 refer to **Circuit/System Testing**.

1. Vehicle in Service Mode.
2. Verify that DTC P0601 - P0606, P06A3, and P16F3 is not set.
 - **If a DTC is set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.
 - **If a DTC is not set**
3. Verify the scan tool Throttle Body Idle Air flow Compensation parameter is less than 90 %.
 - **If 90 % or greater**

Refer to Throttle Body Inspection and Cleaning .
 - **If less than 90 %**
4. Verify that DTC P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, or P2135 are not set.
 - **If DTC P0122, P0123, P0222, P0223, or P2135 are the only DTCs set**

Replace the Q38 Throttle Body.
 - **If DTC P16A0, P16A1, or P16A2 is set with any of the DTCs**

Refer to Circuit/System Testing
 - **If none of the DTCs are set**
5. Verify the Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.
 - **If Agree is not displayed**

Replace the Q38 Throttle Body.
 - **If Agree is displayed**
6. Verify DTC P0122, P0123, P0222, P0223, P16A0, P16A1, P16A2, and P2135 is not set.
 - **If a DTC is set**

Refer to Circuit/System Testing.
 - **If a DTC is not set**
7. Determine the current vehicle testing altitude.

8. Verify the scan tool MAP Sensor pressure parameter is within range specified in the [Altitude Versus Barometric Pressure](#) table.

- **If the MAP Sensor pressure is not in range**

Refer to [DTC P0106](#).

- **If the MAP Sensor pressure is within range**

9. Engine idling.

10. Verify the scan tool MAP Sensor pressure parameter is between 26 - 52 kPa (3.8 - 7.5 psi) and changes with accelerator pedal input.

- **If not between 26 - 52 kPa (3.8 - 7.5 psi) or does not change**

Refer to [DTC P0106](#).

- **If between 26 - 52 kPa (3.8 - 7.5 psi) and changes**

11. Engine speed between 1, 375 and 1, 425 RPM, and at normal operating temperature.

12. Verify the scan tool MAF Sensor parameter is between 1, 800 and 2, 400 Hz.

- **If the MAF Sensor parameter is not between 1, 800 and 2, 400 Hz.**

Refer to [DTC P0101](#).

- **If the MAF Sensor parameter between 1, 800 and 2, 400 Hz.**

13. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

14. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

15. All OK.

Circuit/System Testing

NOTE: **Disconnecting the throttle body harness connector causes additional DTCs to set.**

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at Q38 Throttle Body. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 4 and ground.

- **If 5 Ω or greater**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 5 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

6. Replace the Q38 Throttle Body.

Repair Instructions

- [Throttle Body Assembly Replacement](#)
- [Control Module References](#) for engine control module replacement, programming, and setup

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Vehicle in Service Mode.
6. Verify the Throttle Position Sensors 1 and 2 Agree/Disagree parameter displays Agree while performing the Throttle Sweep Test with a scan tool.

- **If Agree is not displayed**

Test or replace the Q38 Throttle Body.

- **If Agree is displayed**

7. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not set.

- **If DTC sets**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If DTC does not set**

8. All OK.

DTC P0128: ENGINE COOLANT TEMPERATURE (ECT) BELOW THERMOSTAT REGULATING TEMPERATURE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0128

Engine Coolant Temperature (ECT) Below Thermostat Regulating Temperature

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
ECT Sensor Signal	P0117, P0119	P0118	P0118*	P0116, P0119, P0128
Low Reference	-	P0118, P0119	-	P0119, P0128

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
*ECM or sensor damage may occur if the circuit is shorted to B+				

Typical Scan Tool Data

ECT Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine running			
Parameter Normal Range: Varies with coolant temperature			
ECT Sensor Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)

Circuit/System Description

The engine control module (ECM) monitors the temperature of the engine coolant for engine control and as enabling criteria for some diagnostics. The ECM monitors the amount of time to reach a predetermined temperature based on the Start up ECT sensor. The ECM uses this temperature to determine if the engine has warmed up to the thermostat regulating temperature. If the engine coolant temperature does not increase normally or does not reach the thermostat regulating temperature, diagnostics that use the ECT as enabling criteria, may not run when expected. If the engine coolant temperature fails to reach the thermostat regulating temperature, before a predetermined amount of time, the DTC sets.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P00B3, P00B4, P00B6 or P010C are not set.
- The start-up ECT sensor is between -40 to 69Â°C (19 to 156Â°F).
- The engine OFF time is greater than 30 min.
- The engine run time is between 10 s and 30 min.
- The thermostat heater duty cycle is less than 50%.
- The fuel ethanol percentage is 87 % or less.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

- The ECM determines that the modeled ECT has met the calibrated target of 74Â° C (165 Â°F) and the measured ECT is less than 63Â° C (145Â° F) for greater than 1 s.

OR

- The ECM determines that the modeled ECT has met the calibrated target of 55Â° C (131 Â°F) and the measured ECT is less than 25Â° C (77Â° F) for greater than 1 s.

Action Taken When the DTC Sets

- DTC P0128 is a Type B DTC.
- The engine is forced ON and Autostop is disabled.

Conditions for Clearing the DTC

DTC P0128 is a Type B DTC.

Diagnostic Aids

- DTC P0128 can fail when there is a Q66 Passenger Compartment Heater Coolant Control Valve fault.
- Failing DTC P0128 will in turn set an A/C disabled message.

Circuit/System Verification

1. Engine Running
2. Verify DTC P00B3, P00B4, P00B6, P0116, P0117 or P0118 is not set.
 - **If DTC P00B3, P00B4, P00B6, P0116, P0117 or P0118 is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
 - **If DTC P00B3, P00B4, P00B6, P0116, P0117 or P0118 is not set**
3. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.
 - **If a condition is found**

Refer to [Cooling System Draining and Filling](#) , and [Loss of Coolant](#) .

- **If a condition is not found**

4. Engine Running for 15 min with the A/C OFF.
5. Command the Engine Coolant Thermostat Heater to 0 % with a scan tool, engine at 2, 000 RPM.
6. Verify the scan tool ECT Sensor parameter is between 80Â° C and 102Â° C (176Â° F and 215Â° F).
 - **If ECT sensor is not between 80Â° C and 102Â° C (176Â° F and 215Â° F)**

Replace the engine coolant thermostat.

- **If ECT sensor is between 80Â° C and 102Â° C (176Â° F and 215Â° F)**

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
8. Verify the DTC does not set.

- **If the DTC sets**

Refer to step 1.

- **If the DTC does not set**

9. All OK.

*If equipped				

Typical Scan Tool Data

HO2S 1 or 2

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine operating in Closed Loop			
Parameter Normal Range: 23 - 1 930 mV			
HO2S 1 or 2 High Signal	0 mV	1700 - 2 100 mV	1700 - 2 100 mV
HO2S 1 or 2 Low Signal	-	1700 - 2 100 mV	1700 - 2 100 mV

Circuit/System Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an open loop mode, ignoring the HO2S signal voltage while calculating the air to fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0 - 1 275 mV. Once sufficient HO2S voltage fluctuation is observed by the control module, closed loop is entered. The control module uses the HO2S voltage to determine the air to fuel ratio. An HO2S voltage that increases toward 1 000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter closed loop earlier and the control module to calculate the air to fuel ratio sooner.

Conditions for Running the DTC

DTC P0131 or P0137

- DTCs P0068, P0106, P0108, P0122, P0123, P0201, P0202, P0203, P0204, P0222, P0223, P0442, P0443, P0449, P0452, P0455, P0496, P0606, P16F3 and P2101 are not set.
- The Ignition voltage is between 10 - 32 V.
- The fuel level is greater than 10%.
- The fuel composition is less than 87% ethanol.
- The fuel system is in Closed Loop.

- The engine is not decelerating.
- DTC P0131 runs continuously when the above conditions are met for greater than 3 s.
- DTC P0137 runs continuously when the above conditions are met for greater than 5 s.

DTC P0132 or P0138

- DTCs P0106, P0108, P0201, P0202, P0203, P0204, P0442, P0443, P0449, P0452, P0453, P0455 and P0496 are not set.
- The Ignition voltage is between 10 - 32 V.
- The Ignition is OFF for greater than 8 h.
- The fuel level is greater than 10%.
- The fuel composition is less than 87% ethanol.
- The fuel system is in Closed Loop.
- The engine runtime is greater than 5 s.
- The engine is not decelerating.
- DTC P0132 and P0138 run continuously when the above conditions are met for greater than 3 s.

Conditions for Setting the DTC

P0131 or P0137

The engine control module detects that the heated oxygen sensor voltage is less than 40 mV for greater than 40 s.

P0132 or P0138

The engine control module detects that the heated oxygen sensor voltage is greater than 1 050 mV for greater than 10 s.

Action Taken When the DTC Sets

DTCs P0131, P0132, P0137 and P0138 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0131, P0132, P0137 and P0138 are Type B DTCs.

[Circuit/System Verification](#)

1. Ignition ON.
2. Verify no HO2S heater DTCs are set.
 - **If a HO2S heater DTC is set.**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If no HO2S heater DTC is set.**
3. Allow the engine to reach operating temperature, engine running.
4. Verify the scan tool HO2S Sensor 1 or 2 voltage parameters are between 50 - 1 050 mV.
 - **If not between 50 - 1 050 mV.**

Refer to Circuit/System Testing.
 - **If between 50 - 1 050 mV.**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets.**

Refer to Circuit/System Testing.
 - **If the DTC does not set.**
7. All OK.

[Circuit/System Testing](#)

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the appropriate B52 Heated Oxygen Sensor. It may take up to 2 min for all vehicle systems to power down. Ignition ON.
2. Test for 1.7 - 3.0 V between the high signal circuit terminal 4 and ground.
 - **If less than 1.7 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the high signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the high signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 3.0 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 1 V between the high signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 1.7 - 3.0 V**
 3. Verify the scan tool heated oxygen sensor Bank 1 or 2 Sensor 1 or 2 parameter is between 1.7 - 2.1 V.
 - **If less than 1.7 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the low signal circuit terminal 3 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If between 1.7 - 2.1 V**
 4. Connect a 3 A fused jumper wire between the high signal circuit terminal 4 and the low signal circuit terminal 3.

NOTE: **The low signal circuit is tied to a pull-up circuit within the engine control module. A voltage of 0.0 - 1.10 V on the low signal circuit is normal.**

5. Verify the scan tool heated oxygen sensor Bank 1 or 2 Sensor 1 or 2 parameter displays 0.0 V.
 - **If greater than 0.0 V**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.
 2. Test for less than 2 Ω in the low signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω .
 3. Test for less than 1 V between the low signal circuit terminal 3 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If 0.0 V**
6. Verify none of the following conditions exist:
 - Lean or rich fuel injectors. Refer to [Fuel Injector Diagnosis](#) .
 - Water intrusion in the HO2S harness connector
 - Low or high fuel system pressure. Refer to [Fuel System Diagnosis](#) .
 - Fuel that is contaminated. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .

- Fuel saturation of the evaporative emission (EVAP) canister
- Exhaust leaks
- Engine vacuum leaks
- **If any of the conditions exist**

Repair as necessary.

- **If none of the conditions exist**

7. Test or replace the B52 Heated Oxygen Sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Heated Oxygen Sensor Replacement - Sensor 1
- Heated Oxygen Sensor Replacement - Sensor 2
- Perform the scan tool Heated Oxygen Sensor Resistance Learn Reset after replacing a HO2S.
- Control Module References for ECM replacement, programming, and setup

Circuit/System Description

The heated oxygen sensors (HO2S) are used for fuel control and catalyst monitoring. Each HO2S compares the oxygen content of the surrounding air with the oxygen content of the exhaust stream. When the engine is started, the control module operates in an Open Loop mode, ignoring the HO2S signal voltage while calculating the air-to-fuel ratio. While the engine runs, the HO2S heats up and begins to generate a voltage within a range of 0 - 1, 000 mV. Once sufficient HO2S voltage fluctuation is observed by the control module, Closed Loop is entered. The control module uses the HO2S voltage to determine the air-to-fuel ratio. An HO2S voltage that increases toward 1, 000 mV indicates a rich fuel mixture. An HO2S voltage that decreases toward 0 mV indicates a lean fuel mixture.

The heating elements inside each HO2S heat the sensor to bring the sensor up to operating conditions faster. This allows the system to enter Closed Loop earlier and the control module to calculate the air-to-fuel ratio

sooner.

Conditions for Running the DTC

P0133

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0131, P0132, P0134, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300 - P0308, P0442, P0443, P0446, P0449, P0452, P0453, P0455, P0496, P1104, P1248, P1249, P124A, P124B, P124C, P124D, P124E, P124F, P1516, P16F3, P2100 - P2103, P2119, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P217B, P217C, P217E, P217F, P2176, P2227 - P2230 are not set.
- The Ignition voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The engine coolant temperature (ECT) is warmer than 60°C (140°F).
- The intake air temperature (IAT) is warmer than -40°C (-40°F)
- The fuel level is greater than 10%.
- The engine run time is greater than 30 s.
- The engine speed is between 1,000 - 3,500 RPM.
- The barometric (BARO) pressure is greater than 70 kPa.
- The mass airflow (MAF) is between 12 - 60 g/s.
- The fuel system is in Closed Loop.
- Device controls are not active.
- Ethanol content is less than 87%.
- Fuel control is not in power enrichment.
- Decel fuel cut-off is not active.
- The DTCs run once per drive cycle when the above conditions are met for 4 s.

P013A or P013E

- Before the ECM can report DTC P013A, or P013C failed, DTCs P013E, P014A, P2270, and P2272 must run and pass.
- Before the ECM can report DTC P013E, or P014A failed, DTCs P2270 and P2272 must run and pass.
- DTCs P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0120, P0121, P0122, P0123, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0201 - P0208, P0220, P0222, P0223, P0300 - P0308, P0442, P0443, P0446, P0449, P0455, P0496, P1133, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271, P2A00 are not set.
- The Ignition voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The learned heater resistance is valid.

- The fuel level is greater than 10%.
- After the above conditions are met decel fuel cut-off continues without driver initiated pedal input.
- The DTCs run once per ignition cycle, during decel fuel cut-off (DFCO), when the above conditions are met.

P013B or P013F

- Before the ECM can report DTC P013B, or P013D failed, DTCs P013A, P013C, P013E, P013F, P014A, P014B, P2270, P2271, P2272, and P2273 must run and pass.
- Before the ECM can report DTC P013F, or P014B failed, DTCs P013A, P013C, P013E, P014A, P2270, P2271, P2272, and P2273 must run and pass.
- DTCs P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0120, P0121, P0122, P0123, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0201 - P0208, P0220, P0222, P0223, P0300 - P0308, P0442, P0443, P0446, P0449, P0455, P0496, P1133, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271, P2A00 are not set.
- The Ignition voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The learned heater resistance is valid.
- The fuel level is greater than 10%.
- After the above conditions are met, fuel enrich mode is continued.
- The DTCs run once per ignition cycle when the above conditions are met.

P015A or P015B

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0220, P0222, P0223, P0442, P0443, P0446, P0449, P0455, P0496, P1516, P2101, P2119, P2135, P2176 are not set.
- The Ignition voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The engine coolant temperature (ECT) is warmer than 60°C (140°F).
- The intake air temperature (IAT) is warmer than -40°C (-40°F)
- The fuel level is greater than 10%.
- The engine run time is greater than 30 s.
- The engine speed is between 1, 100 - 3, 500 RPM.
- The vehicle speed is between 52 - 124 km/h (32 - 77 mph).
- The mass airflow (MAF) is between 2 - 50 g/s.
- The fuel system is in Closed Loop.
- Device controls are not active.
- The evaporative emission (EVAP) diagnostics are not in control of purge.
- The heated oxygen sensor 1 heater is on for greater than 40 s.

- The heated oxygen sensor 2 heater is on for greater than 175 s
- After the above conditions are met for 1 s the fuel mixture is forced rich.
- At the end of the forced rich fuel state, the heated oxygen sensor 1 is greater than 0.690 V and decel fuel cut-off is active.
- The DTCs run once per drive cycle when the above conditions are met.

P2270

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P013A, P013B, P013E, P013F, P0171, P0172, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0300, P0411, P0412, P0418, P1174, P1516, P2101, P2119, P2135, P2176, P2270, P2271 are not set.
- The system voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The fuel level is greater than 10%.
- The engine speed is between 1, 100 - 3, 500 RPM.
- The engine airflow is between 2 - 50 g/s.
- The vehicle speed is between 52 - 124 km/h (32 - 77 mph).
- The fuel state is in Closed Loop.
- The evaporative emission (EVAP) diagnostics are not in control of purge.
- The HO2S heaters are ON for more than 180 s.
- The predicted catalytic converter temperature is between 550 - 910Â°C (1, 022 - 1, 670Â°F).
- This DTC runs once per trip when all of the above conditions have been met for 2 s.

P2271

- DTCs P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0116, P0117, P0118, P0120, P0121, P0122, P0123, P0128, P013A, P013B, P013E, P013F, P0171, P0172, P0201, P0202, P0203, P0204, P0220, P0222, P0223, P0300, P0411, P0412, P0418, P1174, P1516, P2101, P2119, P2135, P2176, P2270 are not set.
- The system voltage is between 10 - 32 V.
- The engine is OFF for greater 8 hours.
- The fuel level is greater than 10%.
- The engine speed is between 1, 100 - 3, 500 RPM.
- The engine airflow is between 2 - 50 g/s.
- The vehicle speed is between 52 - 124 km/h (32 - 77 mph).
- The fueling state is in Closed Loop.
- The evaporative emission (EVAP) diagnostics are not in control of purge.
- Power take-off is not active.
- The heated oxygen sensor heaters have been on more than 180 s.
- The predicted catalyst temperature is between 550 - 910Â°C (1, 022 - 1, 670Â°F).
- DTCs P013A, P013E, and P2270 have run and passed.

THEN

- Decel fuel cut-off is active.
- The accelerator pedal position is stable.
- This DTC runs once per trip when the above conditions are met for 3 s.

Conditions for Setting the DTC

P0133, P015A or P015B

- The engine control module detects that the heated oxygen sensor rich-to-lean or lean-to-rich average response time is greater than a calibrated value.
- The DTCs set within 60 s when the above condition is met.

P013A

The engine control module detects that the accumulated mass air flow monitored during rich-to-lean transitions between 450 - 150 mV is greater than 75 grams.

P013B

The engine control module detects that the accumulated mass air flow monitored during lean-to-rich transitions between 300 - 600 mV is greater than 75 grams.

P013E

The engine control module detects that the heated oxygen sensor voltage has not decreased below 450 mV within a calibrated value of accumulated air flow.

P013F

The engine control module detects that the heated oxygen sensor voltage has not increased above 300 mV within a calibrated value of accumulated air flow.

P2270

The engine control module does not detect a heated oxygen sensor voltage greater than 825 mV before accumulated mass air flow exceeds a calibrated value.

P2271

The engine control module does not detect an heated oxygen sensor voltage less than 100 mV before accumulated mass air flow exceeds a calibrated value.

Action Taken When the DTC Sets

- DTCs P0133, P013E, P013F, P2270, and P2271 are Type B DTCs.
- DTCs P013A, P013B, P015A, and P015B are Type A DTCs.

Conditions for Clearing the DTC

- DTCs P0133, P013E, P013F, P2270, and P2271 are Type B DTCs.
- DTCs P013A, P013B, P015A, and P015B are Type A DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no HO2S heater DTCs are set.

- **If a DTC is set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If a DTC is not set**

3. Verify none of the conditions listed below exist:

- Lean or rich fuel injectors - Refer to Fuel Injector Diagnosis .
- Water intrusion in the HO2S harness connector
- Low or high fuel system pressure - Refer to Fuel System Diagnosis .
- Fuel that is contaminated - Refer to Alcohol/Contaminants-in-Fuel Diagnosis .
- Fuel saturation of the evaporative emission (EVAP) canister
- Exhaust leaks
- Engine vacuum leaks
- Engine oil consumption - Refer to Oil Consumption Diagnosis .
- Engine coolant consumption - Refer to Loss of Coolant .

- **If any of the above conditions exist**

Repair as necessary.

- **If none of the conditions exist**

4. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

5. Verify the DTC does not set.

- **If the DTC sets**

Test or replace the appropriate B52 HO2S.

- **If the DTC does not set**

6. All OK.

DTC P0171 OR P0172: FUEL TRIM SYSTEM

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0171

Fuel Trim System Lean

DTC P0172

Fuel Trim System Rich

Circuit/System Description

The engine control module (ECM) controls a Closed Loop air/fuel metering system in order to provide the best possible combination of driveability, fuel economy, and emission control. The ECM monitors the heated oxygen sensor (HO2S) signal voltage, and adjusts the fuel delivery based on the signal voltage while in Closed Loop. A change made to the fuel delivery changes the long and short term fuel trim values. The short term fuel trim

values change rapidly in response to the HO2S signal voltages. These changes fine tune the engine fueling. The long term fuel trim values change in response to trends in the short term fuel trim. The long term fuel trim makes coarse adjustments to fueling in order to re-center and restore control to short term fuel trim. The ideal fuel trim values are around 0 %. A positive fuel trim value indicates that the ECM is adding fuel in order to compensate for a lean condition. A negative fuel trim value indicates that the ECM is reducing the amount of fuel in order to compensate for a rich condition.

Conditions for Running the DTC

- DTCs P0030, P0053, P0101, P0102, P0103, P0106, P0107, P0108, P0131 - P0135, P0201 - P0204, P0236, P0237, P0238, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300 - P0304, P0458, P1248, P1249, P124A, P124B, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P2227, P2228, P2229, or P2230 are not set.
- The engine is in Closed Loop status.
- The catalyst monitor diagnostic intrusive test, post 02 diagnostic intrusive test, device control, and evaporative emission leak test are not active.
- The engine coolant temperature (ECT) is between -20 and +150°C (-4 and +302°F).
- The intake air temperature (IAT) is between -20 and +150°C (-4 and +302°F).
- The manifold absolute pressure (MAP) is between 5 - 255 kPa (0.7 - 37 psi).
- The engine speed is between 400 - 6, 100 RPM.
- The mass air flow (MAF) is between 0.5 - 510 g/s.
- The barometric pressure (BARO) is greater than 70 kPa (10.2 psi).
- The fuel level is greater than 10 % and no fuel level sensor fault is present.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

- The average long term fuel trim weighted average value is greater or less than a calibrated value.
- The above condition is present for approximately 3 min after the Conditions for Running the DTC have been met.

Action Taken When the DTC Sets

DTCs P0171 and P0172 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P0171 and P0172 are Type B DTCs.

Diagnostic Aids

- Allow the engine to reach operating temperature. With the engine running, observe the HO2S parameter with a scan tool. The HO2S value should vary from approximately 40 mV to approximately 900 mV, and respond to fueling changes.
- The normal Short Term Fuel Trim and Long Term Fuel Trim parameters should be between +10 and -10 % with 0 % the optimum, with the engine running at operating temperature.
- Any un-metered air into the engine causes this DTC to set. Thoroughly inspect all areas of the engine for

vacuum leaks.

- A MAF sensor condition can cause this DTC without setting a MAF DTC. If there is a MAF sensor condition, the MAF sensor parameters will appear to be within range.
- Verify that the air filter is the correct one for this application. Verify that the engine oil fill cap is in place and that it is tight. Verify that the engine oil dip stick is fully seated.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no other DTCs are set.
 - **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If no other DTCs are set**
3. Verify DTC P0171 or P0172 does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.

5. Verify DTC P0171 or P0172 does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle in Service Mode.

2. Verify the manifold absolute pressure sensor is within the range specified for your altitude. Refer to [**Altitude Versus Barometric Pressure**](#)

- **If not within the specified range**

Refer to [**DTC P0106**](#)

- **If within the specified range**

3. Engine running at the operating temperature.

4. Verify the Long Term Fuel Trim parameter is between -10 % and +10 %.

- **If greater than +10 %**

1. Vehicle OFF.

2. Inspect for the conditions listed below:

- Mass air flow (MAF) sensor signal skewed - If the Short Term Fuel Trim parameter changes greater than 20 % when the MAF sensor is disconnected, refer to [**DTC P0101**](#).
- Fuel contamination - Refer to [**Alcohol/Contaminants-in-Fuel Diagnosis**](#) .
- Missing, restricted, or leaking exhaust components - Refer to [**Symptoms - Engine Exhaust**](#) .
- Malfunctioning fuel injectors - Refer to [**Fuel Injector Diagnosis**](#) .
- Vacuum hoses for splits, kinks, and improper connections
- Insufficient fuel in the tank
- Low fuel pressure - Refer to [**Fuel System Diagnosis**](#) .
- Vacuum leaks at the intake manifold, the throttle body, and the injector O-rings.
- Leaks in the air induction system and the air intake ducts
- Leaks in the components of the vacuum operated engine mount system
- Missing air filter element
- Cracked EVAP canister
- Evaporative pipes obstructed or leaking
- The crankcase ventilation system for leaks - Refer to [**Crankcase Ventilation System Inspection/Diagnosis**](#) .
 - If a condition is found, repair as necessary.
 - If no condition is found, inspect the engine for a mechanical condition. Refer to [**Symptoms - Engine Mechanical**](#) .

- **If less than -10 %**

1. Vehicle OFF.

2. Inspect for the conditions listed below:

- Mass air flow (MAF) sensor signal skewed - If the Short Term Fuel Trim parameters for both banks changes greater than 20 % when the MAF sensor is disconnected, refer to [**DTC P0101**](#).
- Fuel contamination - Refer to [**Alcohol/Contaminants-in-Fuel Diagnosis**](#) .
- Missing, restricted, or leaking exhaust components - Refer to [**Symptoms - Engine Exhaust**](#) .
- Malfunctioning fuel injectors - Refer to [**Fuel Injector Diagnosis**](#)
- Collapsed or restricted air intake duct
- Excessive fuel pressure - Refer to [**Fuel System Diagnosis**](#)
- Dirty or restricted air filter
- Objects blocking the throttle body
- Improper operation of the evaporative emissions control system
- Excessive fuel in the crankcase - Change the engine oil as necessary.

- If a condition is found, repair as necessary.

- If no condition is found, inspect the engine for a mechanical condition. Refer to [**Symptoms - Engine Mechanical**](#) .

- **If between -10 % and +10 %**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.

6. Verify DTC P0171 or P0172 is not set.

- **If any of the DTCs set**

Refer to conditions listed above.

- **If none of the DTCs set**

7. All OK.

Repair Instructions

Perform the [**Diagnostic Repair Verification**](#) after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P0191 OR P0192: FUEL RAIL PRESSURE SENSOR PERFORMANCE

Diagnostic Instructions

- Perform the [**Diagnostic System Check - Vehicle**](#) prior to using this diagnostic procedure.
- Review [**Strategy Based Diagnosis**](#) for an overview of the diagnostic approach.
- [**Diagnostic Procedure Instructions**](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0191

Fuel Rail Pressure Sensor Performance

DTC P0192

Fuel Rail Pressure Sensor Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P018C, P0192, P0340, P0365, P0452, P0506, P0522, P0532, P055C, P0641, P2227, P2228	P0192	P018D, P0453, P0523, P0533, P055D, P0641, P2227	P0191
Signal	P0192, P0506	P0192	-	P0191
Low Reference	-	P0506	-	P0191

Circuit/System Description

The fuel pressure/temperature sensor transmits fuel pressure and temperature information by serial data using the Society of Automotive Engineers (SAE) J2716 Single Edge Nibble Transmission (SENT) protocol. The fuel pressure/temperature sensor internal microprocessor allows 4 separate sensor outputs from one 3 wire sensor. The engine control module (ECM) supplies the fuel pressure/temperature sensor with a 5 V reference circuit, a low reference circuit, and an asynchronous signal/serial data circuit. The asynchronous signal means communication is only going from the fuel pressure/temperature sensor to the ECM. The ECM decodes the serial data signal into separate voltages.

Conditions for Running the DTC

P0191

- The engine is running for greater than 1 min.
- The commanded fuel pressure rate of change, increase or decrease, is less than 3 MPa (435 PSI) for greater than or equal to 1.25 s.
- The DTC runs continuously within the enabling conditions.

P0192

- The engine is cranking or running.
- The DTC runs continuously within the enabling condition.

Conditions for Setting the DTC

P0191

The difference between the commanded high pressure and the measured high pressure is greater than or less

than a predefined threshold for greater than or equal to 1.5 s.

P0192

The ECM detects that the fuel pressure/temperature sensor signal voltage is low for greater than 30 s with the engine running or greater than 10 s with the engine cranking.

Action Taken When the DTC Sets

- DTCs P0191, P0192, are Type A DTCs.
- A message center or an indicator may display Reduced Engine Power.

Conditions for Clearing the DTC

DTCs P0191, P0192 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the fuel pressure/temperature sensor circuits could cause a DTC to set.
- Inspect for a contaminated fuel system.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify there are no DTCs set related to the following system/component: 5V Reference
 - **If any of the DTCs are set**

Refer to: **Diagnostic Trouble Code (DTC) List - Vehicle**
 - **If none of the DTCs are set**
3. Verify there are no DTCs set related to the following system/component: B310 Fuel Pressure/Temperature Sensor
 - **If other DTCs are set - With DTC P0191 set.**

Refer to Circuit/System Testing.
 - **If only DTC P0191 set. is set & No other DTCs related to the concerned component are set.**

Replace the component: B310 Fuel Pressure/Temperature Sensor
 - **If none of the DTCs are set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify that no DTCs are set.
 - **If any of the DTCs are set**

Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
6. All OK.

Circuit/System Testing

NOTE: **Disconnecting the fuel pressure/temperature sensor harness connector causes additional DTCs to set.**

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at B310 Fuel Pressure/Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
 - **If 5 Ω or greater**
 1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 5 Ω**

3. Ignition ON.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.

2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.

- **If less than 4.8 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition OFF, disconnect the harness connector at the K20 Engine Control Module, ignition ON.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

6. Replace the B310 Fuel Pressure/Temperature Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- **Fuel Injection Fuel Rail Fuel Pressure Sensor Replacement** for B310 Fuel Pressure/Temperature Sensor.
- **Control Module References** for control module replacement, programming and setup.

Conditions for Running the DTC

P0182 or P0183

- DTC P126E, P128C, P16E4, or P16E5 is not set.
- DTC P126E or P128C is not pending.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

P0187 or P0188

- DTC P126F, P128D, P16E4, or P16E5 is not set.
- DTC P126F or P128D is not pending.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

P111F

- DTC P0182, P0183, P0187, P0188, P126E, P126F, P128C, P128D, P16E4, or P16E5 is not set.
- DTC P128C, P128D, P16E4, or P16E5 is not pending.
- Ignition is ON.
- The DTC runs continuously when the above conditions are met.

P126E

- DTC P128C, P16E4, or P16E5 is not set.
- DTC P128C is not pending.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

P126F

- DTC P128D, P16E4, or P16E5 is not set.
- DTC P128D is not pending.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0182

The ECM detects the scan tool Fuel Rail Temperature Sensor 1 parameter counts are less than 145 for greater than 6 s.

P0183

The ECM detects the scan tool Fuel Rail Temperature Sensor 1 parameter counts are greater than 1,865 for greater than 6 s.

P0187

The ECM detects the scan tool Fuel Rail Temperature Sensor 2 parameter counts are less than 145 for greater than 6 s.

P0188

The ECM detects the scan tool Fuel Rail Temperature Sensor 2 parameter counts are greater than 1,865 for greater than 6 s.

P111F

The ECM detects the difference between fuel rail temperature sensor 1 and fuel rail temperature sensor 2 is greater than 20°C (68°F) for greater than 12 s.

P126E

The ECM detects the scan tool Fuel Rail Temperature Sensor 1 parameter counts are greater than 4,089 for greater than 6 s.

P126F

The ECM detects the scan tool Fuel Rail Temperature Sensor 2 parameter counts are greater than 4,089 for greater than 6 s.

Action Taken When the DTC Sets

- DTC P0182, P0183, P0187, P0188, P111F, P126E, and P126F are Type B DTCs.
- A message center or an indicator displays Propulsion Power is Reduced and Service Stabilitrak.

Conditions for Clearing the DTC

DTC P0182, P0183, P0187, P0188, P111F, P126E, and P126F are Type B DTCs.

Diagnostic Aids

A high resistance condition on the fuel rail pressure sensor circuits could cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P0641, P0651, P0697, or P06A3 is not set.
 - **If any of the DTCs are set**

Refer to **DTC P0641, P0651, P0697, P06A3, or P06D2** for further diagnosis.
 - **If none of the DTCs are set**
3. Verify that DTC P0182, P0183, P0187, P0188, P111F, P126E, P126F, P128A, P128B, P128C, P128D, P128F, P16E4, or P16E5 is not set.
 - **If DTC P0182, P0183, P0187, P0188, P111F, P126E, or P126F are the only DTCs set**

Test or replace the B47B Fuel Rail Pressure Sensor.
 - **If DTC P128A, P128B, P128C, P128D, P128F, P16E4, or P16E5 is set with any of the DTCs**

Refer to Circuit/System Testing.
 - **If none of the DTCs are set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: **Disconnecting the fuel rail pressure sensor harness connector causes additional DTCs to set.**

1. Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at B47B Fuel Rail Pressure Sensor. It may take up to 2 mins for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Test for 4.8 - 5.2 V between the signal circuit terminal 2 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
- **If between 4.8 - 5.2 V**
6. Replace the B47B Fuel Rail Pressure Sensor.

DTC P018B

Fuel Pressure Sensor Performance

DTC P018C

Fuel Pressure Sensor Circuit Low Voltage

DTC P018D

Fuel Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0106, P0107, P018C, P0532, P0641	P018C	P00C7, P0106, P018D, P0523, P0641	P018B
Signal	P018C	P018C	P018D	P018B
Low Reference	-	P018D, P0453, P0463, P0533, P24BB	P018D	P018B

Circuit/System Description

The fuel pressure sensor is located on the chassis fuel pipe. The fuel pressure sensor monitors the fuel pressure in the fuel line. The engine control module (ECM) monitors the voltage signal from the fuel pressure sensor. The sensor provides a fuel pressure signal to the ECM, which is used to provide Closed Loop fuel pressure control.

Conditions for Running the DTC

P018B

- DTC P018C, P018D, P0231, P0232, P023F, P0641, P1255, P129D, or P12A6 is not set.
- Engine is running for greater than or equal to 5 s.
- Fuel pump enable circuit is commanded ON.
- Fuel pressure is greater than 0 kPa (0 PSI)
- Low fuel level warning not present.
- The DTC runs continuously when the above conditions are met.

P018C or P018D

- Engine is cranking or running.
- The DTCs run continuously when the above condition is met.

Conditions for Setting the DTC

P018B

The ECM does not detect a normal fuel pressure change of at least 30 kPa (4.4 PSI) when the fuel pump is operating. The fuel pressure sensor performance diagnostic provides a means to detect fuel pressure sensor output that is stuck within the normal operating range of the sensor.

P018C

The ECM detects that the fuel pressure sensor voltage is less than 0.2 V for 1 s.

P018D

The ECM detects that the fuel pressure sensor voltage is greater than 4.8 V for 1 s.

Action Taken When the DTC Sets

DTC P018B, P018C and P018D are Type B DTCs.

Conditions for Clearing the DTC

DTC P018B, P018C and P018D are Type B DTCs.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U0074 or U18A2 is not set or stored in history.

- **If DTC U0074 or U18A2 is set or stored in history**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If DTC U0074 or U18A2 is not set or stored in history**

3. Engine Running.

4. Verify the scan tool Fuel Pressure Sensor parameter is between 0.2 - 4.8 V.

- **If not between 0.2 - 4.8 V**

Refer to Circuit/System Testing.

- **If between 0.2 - 4.8 V**

5. Verify the scan tool Fuel Pressure Sensor increases or decreases when commanding an increase and decrease in Fuel Pressure with a scan tool.

- **If the pressure does not change**

Refer to Circuit/System Testing.

- **If the pressure changes**

6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

7. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B47 Fuel Pressure Sensor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
5. Verify the scan tool Fuel Pressure Sensor parameter is less than 1 V.
 - **If 1 V or greater**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 1 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3, wait 15 s.
7. Verify the scan tool Fuel Pressure Sensor parameter is greater than 4.8 V.
 - **If 4.8 V or less**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 4.8 V**
8. Replace the B47 Fuel Pressure Sensor.

Fuel Injector 4 Control -	P0270	P0204	P0271, P2157	P124B

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the injector high voltage supply circuits. The ECM energizes each fuel injector by grounding the high voltage control circuit of the fuel injector. The ECM monitors the status of the injector high voltage supply circuits and the fuel injector high voltage control circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Conditions for Running the DTC

- DTC P062B is not set.
- The engine is running for greater than or equal to 2 s.
- The ignition voltage is greater than or equal to 11 V.
- The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0201, P0202, P0203, or P0204

The ECM detects the fuel injector control - circuit is open for 2 s.

P0261, P0264, P0267, or P0270

The ECM detects the fuel injector control - circuit is shorted to ground for 2 s.

P0262, P0265, P0268, or P0271

The ECM detects the fuel injector control - circuit is shorted to voltage for 2 s.

P1248, P1249, P124A, or P124B

The ECM detects the fuel injector control + circuit is shorted to the fuel injector control - circuit for 2 s.

P2147, P2150, P2153, or P2156

The ECM detects the fuel injector control + circuit is shorted to ground for 2 s.

P2148, P2151, P2154, or P2157

The ECM detects the fuel injector control + circuit is shorted to voltage for 2 s.

Action Taken When the DTC Sets

DTCs P0201, P0202, P0203, P0204, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P1248, P1249, P124A, P124B, P2147, P2148, P2150, P2151, P2153, P2154, P2156, and P2157 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0201, P0202, P0203, P0204, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P1248, P1249, P124A, P124B, P2147, P2148, P2150, P2151, P2153, P2154, P2156, and P2157 are Type A DTCs.

Diagnostic Aids

- Performing the Fuel Injector Diagnosis may help isolate an intermittent condition. Refer to [Fuel Injector Diagnosis](#).
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

- **If the Cylinder 1 - 4 Injector Control Circuit Status parameters display OK**

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

8. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

9. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the appropriate Q17 Fuel Injector, vehicle in Service Mode.
2. Test for 1/2 of battery voltage $\hat{A} \pm 0.5$ V between the control + circuit terminal 1 and ground.

- **If less than 1/2 of battery voltage $\hat{A} \pm 0.5$ V**

1. Vehicle OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control + circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the control + circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
4. Test for infinite resistance between the control + circuit terminal 1 and the control - circuit terminal 2.
 - If less than infinite resistance, repair the short between the circuits.
 - If infinite resistance, replace the K20 Engine Control Module.
- **If 1/2 of battery voltage $\hat{A} \pm 0.5$ V**
3. Vehicle OFF, connect a test lamp between the control + circuit terminal 1 and the control - circuit terminal 2.
4. Vehicle in Service Mode, engine running.
5. Verify the test lamp flashes ON and OFF.
 - **If the test lamp does not flash**
 1. Vehicle OFF, disconnect the X2 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control - circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the control - circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Vehicle in Service Mode.
 5. Test for less than 1 V between the control - circuit terminal 2 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If the test lamp flashes**
6. Test or replace the Q17 Fuel Injector.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Supply Voltage	P0171, P0232, P023F	P0171, P0232, P023F	P0171, P0232, P023F	P023F, P2635
Low Reference	-	P0232, P023F, P0506	P0232, P023F, P0506	P023F, P2635

Circuit/System Description

The engine control module (ECM) supplies voltage to the fuel pump driver control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump driver control module remains active for 2 s, unless the engine is in crank or run. While this voltage is being received, the fuel pump driver control module supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel line pressure. The fuel pump driver control module monitors the fuel pump voltage to determine if the fuel pump is functioning as commanded.

Conditions for Running the DTC

P0231

- DTC P129E or P12A8 are not present.
- The ignition voltage is between 9 - 32 V.
- The engine is cranking or running.
- The fuel pump enable circuit is commanded ON.
- The fuel pump driver control module output current is less than 75 A.
- The DTC runs continuously when the conditions above are met.

P0232

- DTC P129E or P12A8 are not present.
- The ignition voltage is between 9 - 32 V.
- The fuel pump enable circuit is commanded ON.
- The DTC runs continuously when the conditions above are met.

P023F

- DTC P1255, P129E, or P12A8 are not present.
- The ignition voltage is between 9 - 32 V.
- The fuel pump commanded duty cycle is between 30 - 60 percent.
- The DTC runs continuously when the conditions above are met.

Conditions for Setting the DTC

P0231

The fuel pump driver control module detects that the fuel pump control circuit is shorted to ground for 1 s.

P0232

The fuel pump driver control module detects that the fuel pump output circuit voltage is greater than 4 V for 1 s when the voltage should be 0 V.

P023F

The fuel pump driver control module detects that the fuel pump control circuit is open for 1 s.

Action Taken When the DTC Sets

DTCs P0231, P0232, and P023F are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0231, P0232, and P023F are Type A DTCs.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on Direct Fuel Injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the fuel pump turns ON and OFF when commanding the Fuel Pump Enable On and Off with a scan tool.
 - **If the fuel pump does not turn ON and OFF**

Refer to Circuit/System Testing.
 - **If the fuel pump turns ON and OFF**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module and the G12 Fuel Pump inline harness connector X350.
2. Test for less than 2 Ω in the low reference circuit end to end between the following terminals:
 - X350 terminal 16
 - K111 Fuel Pump Driver Control Module terminal 16

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

3. Connect the harness connector at the K111 Fuel Pump Driver Control Module.
4. Vehicle in Service Mode, connect a test lamp between the fuel pump control circuit terminal 1 and the low reference circuit terminal 16 on the body side of connector X350.
5. Verify the test lamp turns ON and OFF when commanding the Fuel Pump Enable On and Off with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module.
2. Test for infinite resistance between the fuel pump control circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the fuel pump control circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , test or replace the K111 Fuel Pump Driver Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K111 Fuel Pump Driver Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the fuel pump control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, test or replace the K111 Fuel Pump Driver Control Module.

- **If the test lamp turns ON and OFF**

6. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module and at the G12 Fuel Pump. It may take up to 2 minutes for all vehicle systems to power down.
7. Test for infinite resistance between the low reference circuit and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

8. Test for less than 2 Ω in the low reference circuit end to end.

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

9. Test for infinite resistance between the fuel pump control circuit and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

10. Test for less than 2 Ω in the fuel pump control circuit end to end.

- **If 2 Ω or greater**

Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

11. Replace the G12 Fuel Pump.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module.
2. Connect a DMM, set on the diode setting, with the positive lead at terminal 16 and the negative lead at terminal 9 of the K111 Fuel Pump Driver Control Module
3. Test for 0.4 - 0.8 V between terminal 16 and terminal 9.

- **If not between 0.4 - 0.8 V**

Replace the K111 Fuel Pump Driver Control Module.

- **If between 0.4 - 0.8 V**

4. Connect a DMM, set on the diode setting, with the positive lead at terminal 9 and the negative lead at terminal 16 of the K111 Fuel Pump Driver Control Module
5. Test for OL between terminal 9 and terminal 16.

- **If not OL**

Replace the K111 Fuel Pump Driver Control Module.

- **If OL**

6. All OK

DTC P0300-P0304: ENGINE/CYLINDER MISFIRE DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0300

Engine Misfire Detected

DTC P0301

Cylinder 1 Misfire Detected

DTC P0302

Cylinder 2 Misfire Detected

DTC P0303

Cylinder 3 Misfire Detected

DTC P0304

Cylinder 4 Misfire Detected

Circuit/System Description

The engine control module (ECM) uses information from the crankshaft position sensor and the camshaft position sensor to determine when a engine cylinder misfire is occurring. By monitoring variations in the crankshaft rotation speed for each cylinder, the ECM can detect individual cylinder misfire events.

Extreme cylinder misfire events can cause catalytic converter damage. The malfunction indicator lamp (MIL) will flash when the conditions for catalytic converter damage are present. DTCs P0301 through P0304 correspond to cylinders 1 through 4. When the ECM detects that one or more specific cylinders are misfiring, the DTC for the respective misfiring cylinder will set and up to 2 of the corresponding fuel injectors are disabled for a minimum of 30 s. The ECM will then re-enable the fuel injector and, after approximately 200 engine revolutions, will determine if the misfire is still present. If the misfire is still present, the ECM will disable the fuel injector again repeating the process. If the misfire is not present, the fuel injector will remain enabled by the ECM. In Spark Ignition Direct Injection (SIDI) system applications, if a fuel injector fault DTC is set during a misfire event, the ECM will not re-enable the injector.

Conditions for Running the DTC

- DTC P0010, P0011, P0013, P0014, P0016, P0017, P0068, P00C8, P00C9, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0122, P0123, P0191, P0192, P0193, P0222, P0223, P0335, P0336, P0340, P0341, P0365, P0366, P0601, P0604, P0606, P0651, P16A0, P16A1, P16A2, P16F3, P2101, P2135, P2227, P2228, P2229, or P2230 is not set.
- The engine speed is less than 1, 000 RPM and DTC P0315 is set.
- The engine speed is greater than 1, 050 RPM.
- The crankshaft position and camshaft position sensors are synchronized.
- The engine coolant temperature (ECT) is between -12 and 127Â°C (10 - 261Â°F).
- If the ECT is colder than -12Â°C (10Â°F) at start-up, this diagnostic will not run until the ECT is between 21 - 127Â°C (70 - 261Â°F).

- The battery voltage is between 9 - 32 V.
- The ECM is not detecting a rough road signal.
- The fuel level is at least 11%.
- The ECM is not in fuel cut-off or deceleration fuel cut-off mode.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0300

The ECM detects a crankshaft rotation speed variation indicating a misfire rate sufficient to cause emissions levels to exceed a predetermined value or a misfire rate high enough to cause catalyst damage.

P0301, P0302, P0303, or P0304

The ECM detects a crankshaft rotation speed variation indicating a single cylinder misfire rate sufficient to cause emissions levels to exceed mandated standards.

Action Taken When the DTC Sets

- DTCs P0300 - P0304 are Type B DTCs.
- Engine idle speed will increase to 2500 RPM.
- The ECM will flash the malfunction indicator lamp (MIL) when a catalyst damaging level of misfire is present.

Conditions for Clearing the DTC

DTCs P0300 - P0304 are Type B DTCs.

Diagnostic Aids

- A misfire DTC could be caused by an excessive vibration from sources other than the engine. Inspect for the conditions listed below:
 - A tire or wheel that is out of round or out of balance
 - Variable thickness brake rotors
 - An unbalanced drive shaft
 - Certain rough road conditions
 - Transmission operation
 - A damaged or defective accessory drive component or belt
- High resistance in the circuits of the injectors may set a misfire DTC without setting an injector DTC. Test the injector circuits of the affected cylinder(s) for a high resistance if you suspect a condition.
- If the condition is intermittent, observing the scan tool IC Circuit Test and Fuel Injector Circuit Test Status parameters may help isolate the condition. The circuit test status parameters will change from OK or Not Run to Fault/Malfunction if a condition exists.
- A condition in the heated O2 sensor (HO2S) heater control circuits may set a DTC P0300.

Special Tools

EL26792 Spark Tester

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

NOTE: If the hybrid battery is fully charged and the hood is opened, the engine runs at a very low load since the hybrid battery cannot accept any additional charge. At this very low engine load, engine misfire may not be detected. Ensure that the battery state of charge indicator on the IPC is at least 2 bars below fully charged before proceeding.

Before starting the engine, review the freeze frame failure records data to determine if the misfire sets during a cold start or at operating temperature. If there is a cold start condition and the engine is started, the engine will need to be cooled down before the next attempt to start the engine within the fail conditions.

1. Perform the scan tool [Crankshaft Position Variation Learn](#) procedure.
2. Verify no DTCs are set.
 - If any DTCs other than P0300 - P0304 are set
Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - If DTC P0300 - P0304 is set
Refer to Circuit/System Testing.
 - If no DTCs are set
3. Verify the scan tool Cylinder 1 - 4 Current Misfire Counter parameters do not increment.
 - If increments
Refer to Circuit/System Testing.

- **If does not increment**

4. Engine Running, perform the Cylinder Power Balance Test with a scan tool.
5. Verify the engine speed changes when each injector is disabled and then enabled.

- **If engine speed does not change**

Refer to Circuit/System Testing.

- **If engine speed does change**

6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

1. Verify none of the following conditions listed below exist:

- Damage, carbon tracking, or fluid intrusion of the spark plug boots and/or spark plugs
- Vacuum hose splits, kinks, and incorrect connections
- Engine vacuum leaks
- Crankcase ventilation system for vacuum leaks
- Fuel pressure that is too low or too high. Refer to [Fuel System Diagnosis](#) .
- Contaminated fuel. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#) .
- Exhaust system restrictions

- **If a condition exists**

Repair or replace as necessary.

- **If no conditions exist**

NOTE: **An erratic or weak spark is considered a no spark condition.**

2. Vehicle OFF, remove the appropriate T 8 Ignition Coil from the spark plug and connect the **EL 26792** HEI Spark Tester to the spark plug boot.
3. Engine Running momentarily.
4. Verify the spark output.

- **If no output or the output is weak**

Refer to [Electronic Ignition System Diagnosis](#) .

- **If the output is good**

5. Vehicle OFF.

6. Verify the conditions listed below. Refer to [Ignition System Specifications](#) .

- The correct spark plug type
- The correct spark plug gap
- The correct spark plug torque
- **If a condition exists**

Repair or replace as necessary.

- **If no conditions exist**

7. Exchange the suspect spark plug with another cylinder that is operating correctly.

8. Engine Running.

9. Verify the scan tool Cylinder 1 - 4 Current Misfire Counter does not increment for the cylinder where the suspect spark plug was installed.

- **If increments**

Replace the spark plug.

- **If does not increment**

10. Test or inspect for the conditions listed below:

- A lean or rich Q17 Fuel Injector - Refer to [Fuel Injector Diagnosis](#) .
- An engine mechanical condition - Refer to [Symptoms - Engine Mechanical](#) .

Repair Instructions

- [Ignition Coil Replacement](#)
- [Spark Plug Replacement](#)

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 s.
5. If the repair was related to a DTC, duplicate the Conditions for Running the DTC and use the Freeze Frame/Failure Records, if applicable, in order to verify the DTC does not reset. If the DTC resets or another DTC is present, refer to the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) and perform the appropriate diagnostic procedure.
6. Engine Running, verify the scan tool Cylinder 1 - 4 Current Misfire Counter parameters do not increment.
 - If the misfire counter parameters increment, a misfire condition still exists.
7. To verify that the performance of the catalytic converter has not been affected by the condition that set this DTC, perform the Repair Verification for DTC P0420. Refer to [DTC P0420](#).

DTC P0315: CRANKSHAFT POSITION SYSTEM VARIATION NOT LEARNED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0315

Crankshaft Position System Variation Not Learned

Circuit/System Description

The crankshaft position variation learn feature is used to calculate reference period errors caused by slight tolerance variations in the crankshaft, and the crankshaft position sensor. The calculated error allows the engine control module (ECM) to accurately compensate for reference period variations. This enhances the ability of the ECM to detect misfire events over a wider range of engine speed and load conditions.

The crankshaft position system variation compensating values are stored in ECM memory after a learn procedure has been performed and the ignition switch is turned to the OFF position for at least 30 s. If the actual variation is not within the crankshaft position system variation compensating values stored in the ECM, DTC P0300 may set.

If the crankshaft position system variation values are not stored in the ECM memory or a proper ECM power down does not occur after completing the Crankshaft Position Learn Procedure, DTC P0315 sets.

Conditions for Running the DTC

Engine is Running.

The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects that the crankshaft position system variation values are not stored in memory.

Action Taken When the DTC Sets

DTC P0315 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0315 is a Type A DTC.

Diagnostic Aids

This test procedure requires that the vehicle battery has passed a load test and is completely charged. Refer to [Battery Inspection/Test](#) .

DTC P0324, P0326, OR P06B6: KNOCK SENSOR SYSTEM PERFORMANCE/CONTROL MODULE KNOCK SENSOR PROCESSOR PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0324

Knock Sensor System Performance

DTC P0326

Knock Sensor Performance

DTC P06B6

Control Module Knock Sensor Processor Performance

Diagnostic Fault Information

Circuit	Short to	Open/High	Short to	Signal
---------	----------	-----------	----------	--------

	Ground	Resistance	Voltage	Performance
High Signal	P0327, P06B6	P0325	P0328	P0324*, P0326**
Low Signal	P0327	P0325	P0328	P0324*, P0326**
* Signal Performance High ** Signal Performance Low				

Circuit/System Description

The knock sensor enables the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The knock sensor produces an alternating current (AC) voltage signal that varies depending on the vibration level during engine operation. The ECM adjusts the spark timing based on the amplitude and the frequency of the knock sensor signal. The ECM learns a minimum knock sensor noise level for all of the engine speed ranges and monitors the normal knock sensor signal. The ECM monitors the internal knock sensor processor test circuits which perform the open circuit diagnostic.

Conditions for Running the DTCs

P0324 or P0326

- Engine is running for 2 s or greater.
- The engine coolant temperature (ECT) is -40Â°C (-40Â°F) or warmer.
- The intake air temperature (IAT) sensor 1 is -40Â°C (-40Â°F) or warmer.

AND

- Engine speed is 8, 500 RPM or less.
- Engine air flow is 2000 mg or less per cylinder.

OR

- Engine speed is 8500 RPM or greater for 200 or more cumulative revolutions.
- Engine air flow is 2000 mg or greater per cylinder.

OR

- Engine speed is 2250 RPM or greater for 75 or more cumulative revolutions.
- Engine air flow is 30 mg or greater per cylinder.

OR

- Engine speed is 8500 RPM or greater for 100 or more cumulative revolutions.
- Engine air flow is 2000 mg or greater per cylinder.

P06B6

- Engine is running for 2 s or greater.
- Engine speed is between 400 - 8, 500 RPM for 150 or more cumulative revolutions.

- Engine air flow is between 20 - 2000 mg per cylinder.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTCs

P0324

The ECM detects that the knock sensor signal performance is out of the normal calibrated range due to excessive engine knock on a per cylinder basis.

P0326

The ECM detects that the knock sensor signal performance is out of the normal calibrated range due to low signal level.

P06B6

The ECM has detected a fault in the knock sensor processor open circuit diagnostic internal test circuit.

Action Taken When the DTCs Set

- DTCs P0324, P0326, and P06B6, are Type C DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTCs

DTCs P0324, P0326, and P06B6 are Type C DTCs.

Diagnostic Aids

A malfunction in the exhaust gas recirculation (EGR) system may cause DTC P0324 to set.

* Signal Performance High ** Signal Performance Low				

Circuit/System Description

The knock sensor enables the engine control module (ECM) to control the ignition timing for the best possible performance while protecting the engine from potentially damaging levels of detonation. The knock sensor produces an alternating current (AC) voltage signal that varies depending on the vibration level during engine operation. The ECM adjusts the spark timing based on the amplitude and the frequency of the knock sensor signal. The ECM learns a minimum knock sensor noise level for all of the engine speed ranges and monitors the normal knock sensor signal. The ECM monitors the internal knock sensor processor test circuits which perform the open circuit diagnostic.

Conditions for Running the DTCs

P0325

- Engine is running for 2 s or greater.
- Engine speed is between 400 - 5, 500 RPM for 75 or more cumulative revolutions.
- Engine air flow is between 20 - 2000 mg per cylinder.
- The engine coolant temperature (ECT) is -40Â°C (-40Â°F) or warmer.
- The intake air temperature (IAT) sensor 1 is -40Â°C (-40Â°F) or warmer.

P0327 or P0328

Engine speed is less than 8, 500 RPM.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTCs

P0325

The ECM detects that a knock sensor signal circuit is open.

P0327

The ECM detects that the knock sensor low signal circuit is out of the calibrated range.

P0328

The ECM detects that the knock sensor high signal circuit is out of the calibrated range.

Action Taken When the DTCs Set

- DTCs P0325, P0327 and P0328 are Type A DTCs.
- The ignition timing is retarded to reduce the potential of engine damaging spark knock.

Conditions for Clearing the DTCs

DTCs P0325, P0327 and P0328 are Type A DTCs.

Diagnostic Aids

The following conditions listed below may cause a knock sensor DTC to set:

- Sensor damage.
- Knock sensor and engine mounting surface burrs, casting flash, and foreign material.
- Close proximity of hoses, brackets, and engine wiring.
- Loose brackets.
- Loose or broken accessory drive belts, brackets, components.
- An engine mechanical condition. Refer to [Symptoms - Engine Mechanical](#) .

 - **If the DTC is not set**
3. Verify the B68 Knock Sensor mounting bolt is properly tightened. Refer to [Fastener Specifications](#) .
 - **If not tightened to the correct specification**

Repair a necessary.
 - **If tightened to the correct specification**
4. Verify the scan tool parameters listed below display No while moving the related harnesses and connectors of the B68 Knock Sensor.
 - Cylinder 1 Knock Detected
 - Cylinder 2 Knock Detected
 - Cylinder 3 Knock Detected
 - Cylinder 4 Knock Detected
 - **If No is not displayed**

Repair the wiring harness or connectors.
 - **If No is displayed**
5. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the B68 Knock Sensor, vehicle in Service Mode.
2. Test for 1 - 2 V between the low signal circuit terminal 2 and ground.

- **If less than 1 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the low signal circuit terminal 2 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the low signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 2 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the low signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If between 1 - 2 V**

3. Test for 2 - 4 V between the high signal circuit terminal 1 and ground.

- **If less than 2 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the high signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the high signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 4 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the high signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If between 2 - 4 V**

4. Test or replace the B68 Knock Sensor.

Circuit/System Description

The crankshaft position sensor circuits consist of an engine control module (ECM) supplied 5 V reference circuit, low reference circuit, and an output signal circuit. The crankshaft position sensor is a magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of invisible magnetic segments on the edge of the crankshaft position reluctor ring mounted on the crankshaft. Each magnetic segment on the ring is spaced at a 60 segment spacing with 2 missing spaces for a reference gap. The crankshaft position sensor produces an ON/OFF DC voltage of varying frequency with 58 output pulses per crankshaft revolution. The frequency of the crankshaft position sensor output depends on the velocity of the crankshaft. The crankshaft position sensor sends a digital signal which represents an image of the crankshaft position reluctor ring to the ECM as each segment on the ring rotates past the crankshaft position sensor. The ECM uses each crankshaft position signal pulse to determine crankshaft speed and decodes the crankshaft position reluctor ring reference gap to identify crankshaft position. This information is then used to determine the optimum ignition and injection points of the engine. The ECM also uses crankshaft position sensor output information to determine the camshaft relative position to the crankshaft to control camshaft phasing and to detect cylinder

misfire.

Conditions for Running the DTC

P0335 Condition 1

- DTCs P0101, P0102 and P0103 are not set.

OR

- The drive motor 1 is engaged and the engine control module detects camshaft position sensor pulses.

AND

- The airflow into the engine is greater than 1.5 g/s.

Condition 2

- The engine is running.

Condition 3

- DTCs P0365 or P0366 are not set.
- The engine is running.

P0336 Condition 1

- DTCs P0335 is not set.
- The airflow into the engine is greater than 1.5 g/s.
- Engine speed is greater than 450 RPM.

Condition 2

- The engine is running.

Condition 3

- DTCs P0101, P0102, and P0103 are not set.
- The airflow into the engine is greater than 1.5 g/s.

OR

- The drive motor 1 is engaged and the engine control module detects camshaft position sensor pulses.

Condition 4

- DTCs P0365 or P0366 are not set.
- The engine is running.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0335 Condition 1

The ECM does not detect a crankshaft position sensor pulse for greater than 4 s.

Condition 2

The ECM does not detect a crankshaft position sensor pulse for greater than 0.3 s.

Condition 3

The ECM does not detect a crankshaft position sensor pulse for 2 out of 10 engine revolutions.

P0336 Condition 1

The ECM detects that 10 or more crankshaft resynchronizations have occurred within 10 s.

Condition 2

The ECM does not detect the synchronization gap on the reluctor ring for greater than 0.4 s.

Condition 3

The ECM does not detect the synchronization gap on the reluctor ring for 1.5 s after the drive motor 1 was engaged.

Condition 4

The ECM detects less than 51 or greater than 65 crankshaft position sensor pulses during 1 engine revolution for 8 out of 10 engine revolutions.

Action Taken When the DTC Sets

- DTCs P0335 and P0336 are Type B DTCs.
- The camshaft position sensor is used to determine engine position.
- The camshaft actuators are commanded to the parked position, if applicable.

Conditions for Clearing the DTC

DTCs P0335 and P0336 are Type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0651 is not set.
 - **If the DTC is set**

Refer to [DTC P0641, P0651, P0697, P06A3, or P06D2](#) .
 - **If the DTC is not set**
3. Engine Running.
4. Verify the scan tool Crankshaft Position Active Counter parameter increments.
 - **If the counter does not increment**

Refer to Circuit/System Testing.
 - **If the counter increments**
5. Verify the scan tool Crankshaft Position Resync Counter parameter displays 0 counts and the engine does not stumble or stall while moving the related harness/connectors of the B26 Crankshaft Position Sensor.
 - **If greater than 0 counts and the engine stumbles or stalls**

Refer to Circuit/System Testing.
 - **If 0 counts and the engine does not stumble or stall**
6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
7. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B26 Crankshaft Position Sensor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If 2 Ω or less, replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the 5 V reference and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Test for 11 - 16 V between the signal circuit terminal 3 and ground.

- **If less than 11 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance.

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If between 11 - 16 V**

6. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

7. Test for less than 1 V between the signal circuit and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Verify DTC P0336 is not set.

- **If the DTC is set**

NOTE: **The crankshaft position reluctor ring is magnetic and may be functionally damaged if any magnetic object comes in contact with it. This type of damage is not visually detectable but will set the DTC.**

1. Inspect for the conditions listed below:

- Excessive play or looseness of the B26 Crankshaft Position Sensor or the crankshaft position reluctor ring
- Improper installation of the B26 Crankshaft Position Sensor
- Foreign material passing between the B26 Crankshaft Position Sensor and the crankshaft position reluctor ring
- Damaged crankshaft position reluctor ring
- Excessive air gap between the B26 Crankshaft Position Sensor and the crankshaft position reluctor ring
- Timing chain or belt, tensioner, and sprockets for wear or damage
- If a condition is found

Repair or replace as necessary.

- If a condition is not found

2. Replace the B26 Crankshaft Position Sensor.

3. Clear the DTC and test drive the vehicle.

4. Verify the DTC is not set.

- If the DTC is set, replace the crankshaft position reluctor ring.
- If the DTC is not set, all OK.

- **If the DTC is not set**

9. Test or replace the B26 Crankshaft Position Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

The camshaft position sensors each have 3 circuits consisting of an engine control module (ECM) supplied 5 V reference circuit, low reference circuit, and an output signal circuit. The camshaft position sensor is an internally magnetic biased digital output integrated circuit sensing device. The sensor detects magnetic flux changes of the teeth and slots of a 4-tooth reluctor wheel attached to the camshaft. As each reluctor wheel tooth rotates past the camshaft position sensor, the resulting change in the magnetic field is used by the sensor electronics to produce a digital output pulse. The sensor returns a digital ON/OFF DC voltage pulse of varying frequency with 4 varying width output pulses per camshaft revolution that represent an image of the camshaft reluctor wheel. The frequency of the camshaft position sensor output depends on the velocity of the camshaft. The ECM decodes the narrow and wide tooth pattern to identify camshaft position. This information is then

used to determine the optimum ignition and injection points of the engine. The ECM uses the cylinder 1 exhaust camshaft position sensor to determine injector and ignition system synchronization. The intake and exhaust camshaft position sensors are also used to determine camshaft to crankshaft relationship. The ECM also uses camshaft position sensor output information to determine the camshaft relative position to the crankshaft to control camshaft phasing and limp-home operation.

Conditions for Running the DTC

P0340 or P0365 Condition 1

- DTCs P0101, P0102, and P0103 are not set.
- The airflow into the engine is greater than 1.5 g/s.

OR

- The starter is engaged and the engine control module detects camshaft position sensor pulses.

Condition 2

- The engine is running.
- The starter is not engaged.

Condition 3

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.
- The starter is engaged.

Condition 4

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.

P0341 or P0366 Condition 1

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.
- The starter is engaged.

Condition 2

- DTC P0335, P0336, P0641, or P0651 are not set.
- The crankshaft is synchronized.

The DTCs run continuously once the above conditions are met.

Conditions for Setting the DTC

P0340 or P0365 Condition 1

- The ECM does not detect a camshaft position sensor pulse for greater than 5.5 s.

OR

- The ECM does not detect a camshaft position sensor pulse for greater than 4 s since the time the starter has been engaged.

Condition 2

The ECM detects less than 4 camshaft position sensor pulse for greater than 3 s.

Condition 3

The ECM does not detect a camshaft position sensor pulse during the first 2 engine revolutions.

Condition 4

The ECM does not detect a camshaft position sensor pulse during 200 engine revolutions.

P0341 or P0366 Condition 1

- The ECM detects less than 4 camshaft position sensor pulses during 2 engine revolutions.

OR

- The ECM detects greater than 6 camshaft position sensor pulses during 2 engine revolutions.

Contion 2

The ECM detects less than 398 or greater than 402 camshaft position sensor pulses during 200 engine revolutions.

Action Taken When the DTC Sets

- DTCs P0340, P0341, P0365, and P0366 are Type B DTCs.
- The camshaft position actuator is commanded to the Home or Parked position.
- The ignition system defaults to a failed camshaft position sensor limp home mode.

Conditions for Clearing the MIL/DTC

DTCs P0340, P0341, P0365, and P0366 are Type B DTCs.

Diagnostic Aids

- With a DTC set, the engine may crank for an extended period of time at start-up
- The exhaust camshaft position sensor is used for injector and ignition system synchronization. A stalling condition will occur if the camshaft position sensor signal is intermittent and a DTC may not set. Inspect all camshaft position sensor circuits for poor connections.

3. Engine Running.
4. Verify the scan tool parameters listed below increment:
 - Exhaust Camshaft Position Active Counter
 - Intake Camshaft Position Active Counter
 - **If any counter does not increment**

Refer to Circuit/System Testing.

- **If all counters increment**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate B23 Camshaft Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If 2 Ω or less, replace the K20 Engine Control Module.
 - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
 3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

Circuit/System Description

The ignition system on this engine uses an individual coil for each cylinder. The engine control module (ECM) controls the spark event for each cylinder through a dedicated ignition control circuit to each coil. When the ECM commands the ignition control circuit ON, electrical current will flow through the primary winding of the ignition coil, creating a magnetic field. When a spark event is requested, the ECM will command the ignition control circuit OFF, interrupting current flow through the primary winding. The magnetic field created by the primary winding will collapse across the secondary coil windings, producing a high voltage across the spark plug electrodes. The ECM uses information from the crankshaft position sensor, and the camshaft position sensor for sequencing and timing of the spark events. The ECM monitors each ignition control circuit for improper voltage levels.

Conditions for Running the DTC

- The engine is cranking or running.
- Ignition voltage greater than 11 V.

The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match.

Action Taken When the DTC Sets

DTCs P0351, P0352, P0353, P0354, P2300, P2301, P2303, P2304, P2306, P2307, P2309, and P2310 are Type B DTCs.

4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an

accurate ground or low reference circuit continuity test can be performed.

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: T8 Ignition Coil
3. Test for less than 10 ohms between the test points: Ground circuit terminal 1/A & Ground
 - **If 10 ohms or greater**
 1. Disconnect the ground connection: Ground terminal
 2. Test for less than 2 ohms between the test points: Ground circuit terminal 1/ A @Component harness & The other end of the circuit
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Repair the open/high resistance in the ground connection.
 - **If less than 10 ohms**
4. Engine - Running
5. Verify the appropriate scan tool Ignition Coil Control Circuit Low Voltage Test Status does not display Malfunction.
 - **If Malfunction is displayed**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the control circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If Malfunction is not displayed**
6. Verify the appropriate scan tool Ignition Coil Control Circuit High Voltage Test Status does not display Malfunction.
 - **If Malfunction is displayed**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage in the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If Malfunction is not displayed**
7. Vehicle OFF, install a 3 A fused jumper wire between the control circuit terminal 3 or C and ground, engine Running.
8. Verify the appropriate scan tool Ignition Coil Control Circuit Low Voltage Test Status displays Malfunction.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the fused jumper, and disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If Malfunction is displayed**

9. Test or replace the T8 Ignition Coil.

Component Test

NOTE: You must perform the **Circuit/System Testing** before proceeding with **Component Testing**.

1. Vehicle OFF, connect the **EL 26792** HEI spark tester to the appropriate T8 Ignition Coil.
2. Engine Running.
3. Verify the spark output of the T8 Ignition Coil.

- **If no output or the output is weak**

Replace the T8 Ignition Coil.

- **If the output is normal**

4. All OK.

DTC P0401: EXHAUST GAS RECIRCULATION (EGR) FLOW INSUFFICIENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0401

Exhaust Gas Recirculation (EGR) Flow Insufficient

Circuit/System Description

The ECM uses the exhaust gas recirculation (EGR) position sensor to determine the position of the EGR valve. The engine control module (ECM) sends a pulse width modulated voltage signal to the EGR input signal circuit. The ECM provides a voltage return path for the sensor through the low reference circuit. A pulse width modulated signal, based on the EGR valve position, is sent from the sensor to the ECM through the EGR output signal circuit. The ECM compares the actual EGR position with the desired EGR position when the EGR valve is commanded open or closed.

Conditions for Running the DTC

P0121, P0178, P0179, P0201, P0202, P0203, P0204, P0205, P0206, P0207, P0208, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0300, P0301, P0302, P0303, P0304, P0335, P0336, P0403, P0404, P0405, P0406, P042E, P0489, P0490, P0502, P0503, P0506, P0507, P0604, P0641, P0651, P0722, P0723, P1104, P1248, P1249, P124A, P124B, P124C, P124D, P124E, P124F, P1258, P1426, P1437, P2100, P2101, P2102, P2103, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P217B, P217C, P217E, P217F, or P2269 is not set.

- Battery voltage is greater than 11 V.
- Barometric pressure (BARO) is greater than 70 kPa (10 PSI).
- Decel fuel cut-off state does not change for 250 ms.
- Mass air pressure (MAP) change is less than 1 kPa (0.15 PSI).
- MAP is between 20 - 50 kPa (3 - 7 PSI).
- The DTCs run continuously when the above conditions are met for 7 s.

Conditions for Setting the DTC

P0401

The ECM detects the EGR flow is below a calibrated amount when the EGR is commanded ON.

Action Taken When the DTC Sets

DTCs P0401, is a Type A DTC.

Conditions for Clearing the DTC

DTCs P0401 is a Type A DTC.

Diagnostic Aids

A stuck EGR valve or a restriction anywhere in the exhaust gas recirculation system due to excessive coking or debris may cause this DTC to set.

Circuit/System Description

The ECM uses the exhaust gas recirculation (EGR) position sensor to determine the position of the EGR valve. The engine control module (ECM) sends a pulse width modulated voltage signal to the EGR input signal circuit. The ECM provides a voltage return path for the sensor through the low reference circuit. A pulse width modulated signal, based on the EGR valve position, is sent from the sensor to the ECM through the EGR output signal circuit. The ECM compares the actual EGR position with the desired EGR position when the EGR valve is commanded open or closed.

Conditions for Running the DTC

P0403, P0489, or P0490

- The engine is cranking or running.
- The battery voltage is greater than 11 V.

- The EGR control circuit is complete.
- The EGR is commanded on.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0403, P0489

The ECM detects an open circuit of the EGR valve between the signal and controller ground, an open circuit in the motor ignition circuit, or a signal short to ground condition for greater than 30 s.

P0490

The ECM detects a short to voltage condition of the EGR valve signal circuit for greater than 30 s.

Action Taken When the DTC Sets

DTCs P0403, P0489, and P0490 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0403, P0489, and P0490 are Type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.

2. Verify the scan tool parameters listed below display OK:

- EGR Control Circuit Low Voltage Test Status
- EGR Control Circuit Open Voltage Test Status
- EGR Control Circuit High Voltage Test Status
- **If not OK**

Refer to Circuit/System Testing.

- **If OK**

3. Operate the vehicle within the Conditions for Running the DTCs. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

4. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the Q14 Exhaust Gas Recirculation Valve.

2. Test for less than 10 Ω between the motor ground circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the motor ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Verify a test lamp illuminates between the motor ignition circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.

2. Test for less than 2 Ω in the motor ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.

NOTE: A short circuit in any component supplied by the fuse may cause the fuse to open and set a DTC when the component is activated.

2. Disconnect all components on the fused circuit.
3. Test for infinite resistance between the motor ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components supplied by the fuse and replace as necessary.
- **If the test lamp illuminates**
5. Vehicle OFF, and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 Ω between the low reference circuit terminal 5 and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Test for greater than 1 V between the test points:Signal circuit terminal 3 & Ground
 - **If less than 1 V**
 1. Vehicle Off and all vehicle systems Off.
 2. Disconnect the harness connector at the K20 Engine Control Module.
 3. Test for less than 2 Ω in the output signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Test for infinite resistance between the test points:Signal circuit terminal 3 & Ground
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module
 - **If greater than 1 V**
9. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
10. Test for less than 1 V between the input signal circuit and ground.
 - **If 1 V or greater**

Repair the short to voltage on the circuit.
 - **If less than 1 V**
11. Vehicle OFF, connect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
12. Test for greater than 11 V between the test points:Signal circuit terminal 4 & Ground
 - **If less than 11 V**
 1. Vehicle Off and all vehicle systems Off.
 2. Disconnect the harness connector at the K20 Engine Control Module.
 3. Test for less than 2 Ω in the output signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
4. Test for infinite resistance between the test points: Signal circuit terminal 4 & Ground
- If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module
- **If greater than 1 V**
13. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
14. Test for less than 1 V between the output signal circuit and ground.
- **If 1 V or greater**, repair the short to voltage on the circuit.
 - **If less than 1 V**
15. Test or replace the Q14 Exhaust Gas Recirculation Valve.

DTC Descriptors

DTC P0404

Exhaust Gas Recirculation (EGR) Open Position Performance

DTC P042E

Exhaust Gas Recirculation (EGR) Closed Position Performance

Circuit/System Description

The ECM uses the exhaust gas recirculation (EGR) position sensor to determine the position of the EGR valve. The engine control module (ECM) sends a pulse width modulated voltage signal to the EGR input signal circuit. The ECM provides a voltage return path for the sensor through the low reference circuit. A pulse width modulated signal, based on the EGR valve position, is sent from the sensor to the ECM through the EGR output signal circuit. The ECM compares the actual EGR position with the desired EGR position when the EGR valve is commanded open or closed.

Conditions for Running the DTC

- DTCs P0401, P0403, P0405, P0406, P0489, or P0490 are not set
- The battery voltage is greater than 11 V.
- The engine is running
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P0404

The ECM detects the desired position of the EGR valve compared to the actual position value is too large for greater than 12 s.

P042E

The ECM detects the EGR valve is stuck open when commanded closed for greater than 1 s.

Action Taken When the DTC Sets

DTC P0404 and P042E are Type B DTCs.

Conditions for Clearing the DTC

DTC P0404 and P042E are Type B DTCs.

 5. All OK.

Circuit/System Testing

1. Verify that the conditions listed below are not present at the Q14 Exhaust Gas Recirculation Valve:
 - Stuck Q14 Exhaust Gas Recirculation Valve
 - Any coking, soot build up, debris or damage that can cause the EGR valve to stick partially open or closed
 - **If a condition is present**

Repair as necessary

 - **If no condition is present**
2. Vehicle OFF, disconnect the harness connector at the Q14 Exhaust Gas Recirculation Valve, vehicle in Service Mode.
3. Verify a test lamp illuminates between the input signal circuit terminal 3 and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp.
 2. Disconnect the harness connector at the K20 Engine Control Module.
 3. Test for less than 2 Ω in the input signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 4. Test for infinite resistance between the input signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module
 - **If the test lamp illuminates**
4. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service

Mode.

5. Test for less than 1 V between the input signal circuit and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

6. Vehicle OFF, connect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

7. Verify a test lamp illuminates between the output signal circuit terminal 4 and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF, remove the test lamp.

2. Disconnect the harness connector at the K20 Engine Control Module.

3. Test for less than 2 Ω in the output signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω

4. Test for infinite resistance between the output signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K20 Engine Control Module

- **If the test lamp illuminates**

8. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

9. Test for less than 1 V between the output signal circuit and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

10. Replace the Q14 Exhaust Gas Recirculation Valve.

EGR Temperature Sensor 1 or 2

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Ignition ON, engine OFF Parameter Normal Range: Varies depending on current ambient temperature and the vehicle operating conditions			
Supply Voltage	200Â°C (392Â°F)	200Â°C (392Â°F)	200Â°C (392Â°F)
Low Reference	-	200Â°C (392Â°F)	200Â°C (392Â°F)

Circuit/System Description

The exhaust gas recirculation (EGR) temperature sensors are variable resistors that measure the temperature of the exhaust gas. The engine control module (ECM) supplies 5 volts to the EGR temperature sensor signal circuit and a ground for the low reference circuit. When the EGR temperature sensor is cold, the sensor resistance is high. When the EGR temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a higher voltage on the EGR temperature signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the EGR temperature signal circuit.

Conditions for Running the DTC

P040B and P041B

- DTC P262B is not set
- System voltage is greater than 11 V
- Engine OFF for greater than 8 h
- The DTCs run continuously when the above conditions are met.

P040C, P040D, P040E, P041C, P041D, and P041E

- System voltage is greater than 11 V
- The engine is cranking or running
- The EGR temperature sensor is commanded ON
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P040B and P041B

- The ECM detects that the EGR temperature sensor has not changed greater than a calibrated amount for greater than a calibrated amount of time following a cold start
- Above conditions must be met for 10 s

P040C and P041C

- The ECM detects that the EGR temperature sensor resistance is less than 100 Ω
- Above conditions must be met for 7 s

P040D and P041D

- The ECM detects that the EGR temperature sensor resistance is greater than 1,400 Ω
- Above conditions must be met for 7 s

P040E and P041E

- The ECM detects that the EGR temperature sensor resistance change is greater than 10 Ω
- Above conditions must be met for 3 s

Action Taken When the DTC Sets

DTCs P040B, P040C, P040D, P040E, P041B, P041C, P041D, and P041E are Type B DTCs.

Conditions for Clearing the DTC

DTCs P040B, P040C, P040D, P040E, P041B, P041C, P041D, and P041E are Type B DTCs.

Diagnostic Aids

- Inspect the EGR temperature sensor terminals for corrosion.

- If the EGR temperature sensor signal circuit is shorted to a separate 5-volt source, the DTC will set.
- If the engine has cooled for at least 8 hrs, the scan tool EGR Temperature Sensor and the Engine Coolant Temperature Sensor values should display within 3Â°C (5Â°F).
- EGR cooler temperature sensors may fail while operating under extreme temperatures. Review the Freeze Frame/Failure Records to verify the failure criteria.
- With a fault present, the sensor reads a software defaulted value of 200Â°C (392Â°F) and does not change with an expected temperature increase or decrease.

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Engine Running.
2. Verify the scan tool EGR Cooler Temperature Sensor parameter is between -39Â° to +999Â°C (-38Â° to +1, 830Â°F) and changes with engine run time.
 - **If not within the specified range or does not change**

Refer to Circuit/System Testing.
 - **If within the specified range and changes**
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Vehicle Off, exchange the suspect harness connector at the B130 Exhaust Gas Recirculation Temperature Sensor with the known functioning Exhaust Gas Recirculation Temperature Sensor, Ignition - On / Vehicle - In Service Mode
2. Verify the DTC related to the known functioning Exhaust Gas Recirculation Temperature Sensor does not set.

- **If the DTC sets**

Test or replace the B130 Exhaust Gas Recirculation Temperature Sensor

- **If the DTC does not set**

3. Vehicle Off, and all vehicle systems Off. Install original harness connector to the known functioning B130 Exhaust Gas Recirculation Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
4. Leave the harness connector at the appropriate B130 Exhaust Gas Recirculation Temperature Sensors disconnected.
5. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 10 Ω**

6. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
7. Test for less than 1 V between the signal circuit and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

8. Test for infinite resistance between the signal circuit terminal 1 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

9. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K20 Engine Control Module.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P0420

Catalyst System Low Efficiency

Circuit/System Description

A 3-way catalyst controls emissions of hydrocarbons, carbon monoxide (CO) and nitrogen oxide (NO_x). The catalyst within the converter promotes a chemical reaction, which oxidizes the hydrocarbons and the CO that are present in the exhaust gas. This process converts the hydrocarbons and the CO into water vapor and carbon dioxide (CO₂), and reduces the NO_x, converting the NO_x into nitrogen. The catalyst also stores oxygen. The engine control module (ECM) monitors this process by using heated oxygen sensors (HO₂S) that are in the exhaust stream before and after the 3- way catalyst. The HO₂S produces an output signal that the ECM uses to calculate the oxygen storage capacity of the catalyst. This indicates the ability of the catalyst to convert the exhaust emissions efficiently. The ECM monitors the efficiency of the catalyst by monitoring the HO₂S during an off-idle, decel fuel cut off (DFCO) event. When the catalyst is functioning properly, the post catalyst HO₂S response to the fuel conditions during the DFCO event is slow compared to the response of the pre catalyst HO₂S. When the post HO₂S response is near that of the pre HO₂S, the oxygen storage capability and efficiency of the catalyst may be degraded below an acceptable threshold.

Conditions for Running the DTC

- DTC P0030, P0031, P0032, P0036, P0037, P0038, P0053, P0054, P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P0131, P0132, P0133, P0135, P0137, P0138, P0141, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300, P0301, P0302, P0303, P0304, P16F3, P2101, P2135, P2270, or P2271 is not set.
- Ignition voltage is between 10 - 32 V.
- HO₂S heater resistance is learned.
- Accelerator pedal position is no more than 3%.

- Mass air flow (MAF) is between 2 - 20 g/s.
- Fuel level is greater than 10%.
- Fuel system is in closed loop.
- Evaporative emissions (EVAP) diagnostics are not in control of purge.
- Predicted catalyst temperature is between 550 - 910°C (1,022 - 1,670°F).
- HO2S heater is commanded On for greater than 60 s.
- Engine speed is between 1,900 - 3,500 RPM to initially enable the test.
- Engine speed is between 1,850 - 3,650 RPM to keep the test enabled.
- Vehicle speed is between 66 - 125 km/h (41 - 78 mph) to initially enable the test.
- Vehicle speed is between 58 - 128 km/h (36 - 80 mph) to keep the test enabled.
- Engine is operating in decel fuel cut off (DFCO).

This diagnostic attempts one test during each valid decel fuel cut off period once the above conditions have been met. This diagnostic attempts up to 3 tests during each drive cycle.

Conditions for Setting the DTC

The ECM has detected that the catalyst efficiency has degraded below a calibrated threshold.

Action Taken When The DTC Sets

DTC P0420 is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P0420 is a Type A DTC.

Diagnostic Aids

Inspect for the conditions listed below, which may cause a catalyst to degrade:

- Engine misfire
- High engine oil or high coolant consumption
- Retarded spark timing
- Weak or poor spark
- Lean fuel mixture
- Rich fuel mixture
- Damaged oxygen sensor or wiring harness

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify there are no other DTCs set.
 - **If other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no other DTCs are set**
3. Operate the vehicle within the Conditions for Running the DTC.
 4. Verify the scan tool Catalyst Monitor Not At Idle Test Conditions Met parameter changes to Yes.
 - **If Yes is not displayed**

Refer to step 3.

 - **If Yes is displayed**
 5. When the conditions are safe, stop and idle the vehicle in gear if equipped with automatic transmission or neutral if equipped with manual transmission.
 6. Verify the Catalyst Monitor Test Result parameter displays Passed when performing the steps listed below:
 1. Apply the service brake.
 2. Monitor the scan tool Catalyst Monitor Test State parameter. When the parameter indicates Active, the Catalyst Monitor Test is running.

NOTE: When the test has completed, the Catalyst Monitor Test Counter parameter will increment by one and the Catalyst Monitor Test Result parameter will indicate Passed, Failed or No Result.

3. Continue to monitor the parameter. When the parameter indicates Inactive, the Catalyst Monitor Test has completed.
 - **If No Result is displayed**

Repeat steps 3 - 6 until the Test Result parameter indicates Passed or Failed

 - **If Failed is displayed**

Refer to Circuit /System Testing

- **If Passed is displayed**

7. All OK.

Circuit/System Testing

1. Verify the conditions listed below do not exist with the catalytic converter:

- Dents
- Severe discoloration caused by excessive temperatures
- Road damage
- Internal rattles caused by damaged catalyst substrate
- Restrictions

- **If a condition is found**

Replace the catalytic converter.

- **If no condition is found**

2. Verify the conditions listed below do not exist with the exhaust system:

- Leaks
- Physical damage
- Loose or missing hardware

- **If a condition is found**

Repair or replace the component as necessary.

- **If no condition is found**

3. Verify the conditions listed below do not exist with the B52B Heated Oxygen Sensor 2:

- Incorrect torque
- Damage

- **If a condition is found**

Replace the B52B Heated Oxygen Sensor 2 or repair the condition as necessary.

- **If no condition is found**

4. Replace the catalytic converter.

Repair Instructions

- **Three-Way Catalytic Converter Replacement**
- **Exhaust Leakage**
- **Heated Oxygen Sensor Replacement - Sensor 2**
- Perform the HO2S Heater Learn procedure with a scan tool after replacing a heated oxygen sensor.
- **Restricted Exhaust**

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Turn Off the ignition for 60 s
5. Operate the vehicle within the Conditions for Running the DTC.
6. Verify the scan tool Catalyst Monitor Not At Idle Test Conditions Met parameter changes to Yes.
 - **If Yes is not displayed**

Refer to step 5.
 - **If Yes is displayed**
7. When the conditions are safe, stop and idle the vehicle in gear if equipped with automatic transmission or neutral if equipped with manual transmission.
8. Verify the Catalyst Monitor Test Result parameter displays Passed when performing the steps listed below:
 1. Apply the service brake.
 2. Monitor the scan tool Catalyst Monitor Test State parameter. When the parameter indicates Active, the Catalyst Monitor Test is running.

NOTE: When the test has completed, the Catalyst Monitor Test Counter parameter will increment by one and the Catalyst Monitor Test Result parameter will indicate Passed, Failed or No Result.

3. Continue to monitor the parameter. When the parameter indicates Inactive, the Catalyst Monitor Test has completed.
 - **If No Result is displayed**

Repeat steps 5 - 8 until the Test Result parameter indicates Passed or Failed
 - **If Failed is displayed**

Refer to Circuit /System Testing
 - **If Passed is displayed**
9. All OK.

DTC P043E, P043F, OR P145F: EVAPORATIVE EMISSION (EVAP) SYSTEM REFERENCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P043E

Evaporative Emission (EVAP) System Reference Orifice Flow Insufficient

DTC P043F

Evaporative Emission (EVAP) System Reference Orifice Flow Excessive

DTC P145F

Evaporative Emission (EVAP) System Reference Orifice Performance

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The engine control module (ECM) monitors the pressure across the reference orifice with the EVAP leak detection pump pressure sensor. When all conditions are met, the ECM commands the vacuum pump ON and monitors the EVAP leak detection pump pressure sensor. If the ECM detects the pressure is too low, too high, or not stabilized, a DTC sets.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P145A, P145C, P145D, P145E, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, or U182D is not set.
- The vehicle is OFF.
- The propulsion system is not active.
- The refueling request button is not pressed
- A service bay test is not active
- The purge valve is closed
- The vent solenoid valve is closed
- The EVAP Leak Detection Pump switching valve is in the vent position
- The EVAP Leak Detection Pump vacuum pump is ON
- The odometer is greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI)
- The fuel level is between 10 - 90%
- The engine coolant temperature is less than 40°C (104°F)
- The intake air temperature is between 4 - 45°C (39 - 113°F)

- The system voltage is greater than 10 V
- The vehicle speed less than 1.6 km/h (1 MPH)
- There are three possible time windows for this test to run. Up to that point, and through this time period, the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 h.

Conditions for Setting the DTC

P043E

- The ECM detects the EVAP leak detection pump pressure is greater than 4 kPa (0.58 PSI) after 6 min.
- OR
- The ECM detects the EVAP leak detection pump pressure is greater than 4.5 kPa (0.65 PSI) after 30 s.

P043F

- The ECM detects the EVAP leak detection pump pressure is less than 1.18 kPa (0.17 PSI) after 6 min.
- OR
- The ECM detects the EVAP leak detection pump pressure is less than 1.18 kPa (0.17 PSI) after 30 s.

P145F

The ECM detects the difference between the first and second EVAP leak detection pump pressure measurement is greater than 0.51 kPa (0.073 PSI).

Action Taken When the DTC Sets

DTCs P043E, P043F and P145F are Type B DTCs.

Conditions for Clearing the DTC

DTCs P043E, P043F and P145F are Type B DTCs.

Diagnostic Aids

- Inspect the tube and clamps from the EVAP leak detection pump to the vent solenoid for damage. A damage/open tube may allow debris to enter the pump and plug the reference orifice.
- Remove the EVAP leak detection pump and look inside the pump opening for any debris that could restrict or plug the reference orifice. The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening. Inspect for missing or damage O-rings.
- With the fresh air tube removed from the EVAP leak detection pump assembly, blow controlled air, 5 - 10 PSI, into this tube. There should be air escaping from behind the fuel fill pocket indicating this tube and filter are not restricted.
- A switching valve stuck in the pump position can cause insufficient flow.
- This part is not serviceable. It is very important that no debris be found in the pump fresh air inlet or vacuum openings, the tube between the vent solenoid valve and EVAP leak detection pump assembly as this could cause a P043E to set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, verify the scan tool EVAP Leak Detection Pump Pressure sensor reading is within the range specified in the **Altitude Versus Barometric Pressure** table.
2. Record the EVAP Leak Detection Pump Pressure sensor reading.
3. Command the EVAP Leak Detection Pump Command ON with the scan tool and monitor the EVAP Leak Detection Pump Pressure.
4. After 6 min record the EVAP Leak Detection Pump Pressure sensor reading. The reading should be 1.18 - 4 kPa (0.17-0.58 PSI) less than the initial reading from step 2.
5. Continue monitoring for an additional 5-10 min and then record the EVAP Leak Detection Pump Pressure sensor reading.
6. The reading should be 1.18 - 4.5 kPa (0.17-0.58 PSI) less than the initial reading from step 2, and the difference between the step 4 and step 5 readings less than 0.51 kPa (.07 PSI)
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within

the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

NOTE: The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening.

1. Vehicle OFF, remove the Q63 Evaporative Emission System Leak Detection Pump Assembly.
2. Inspect the reference orifice within the pump for a restriction/blockage. There should be no restriction.
 - **If the reference orifice is restricted**

Inspect and repair any of the conditions listed below:

- The EVAP leak detection pump to the vent solenoid tube and clamps for damage
- A missing or damage EVAP leak detection pump O-rings
- The fresh air tube near the fuel fill pocket for a restriction
- The fresh air tube for a restriction
- **If all components test normal**

Replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Evaporative Emission System Vacuum Leak Detection Pump Replacement**

DTC P0442 OR P0455: EVAPORATIVE EMISSION (EVAP) SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0442

Evaporative Emission (EVAP) System Small Leak Detected

DTC P0455

Evaporative Emission (EVAP) System Large Leak Detected

Circuit/System Description

This DTC tests the evaporative emission (EVAP) system for a small and large leak when the Vehicle is turned OFF and the correct conditions are met. The propulsion system needs to be OFF for several hours before the

small and large leak tests run. The EVAP leak detection pump creates a vacuum across a 0.51 mm (0.020 in) reference orifice. This reference vacuum is then compared to the vacuum level created in the fuel tank to determine if a leak exists

The following table illustrates the relationship between the ON and OFF states, and the OPEN or CLOSED states of the EVAP components:

Engine Control Module Command	EVAP Canister Purge Solenoid Valve	EVAP Canister Vent Solenoid Valve	Vacuum Pump	Switch Valve
ON	Open	Open/Venting	Pump Runs	Pump Position/Not Venting
OFF	Closed	Closed/Not Venting	Pump OFF	Vent Position

Conditions for Running the DTC

- DTCs P043E, P043F, P06E4, P0111, P0112, P0113, P0114, P0117, P0118, P0116, P0119, P0128, P0449, P0498, P0499, P1458, P145A, P145C, P145D, P145E, P145F, P0451, P0452, P0453, P0461, P0462, P0463, P0502, P0503, P0722, P0723, P1459, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0140, U182D, U0073, U0074, is not set.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The ECT is less than 40Â°C (104Â°F).
- The IAT is between 4 - 45Â°C (39 - 113Â°F).
- The system voltage is greater than 10 V.
- Vehicle speed less than 1.6 km/h (1 MPH).
- A refueling event needs to be detected prior to running this test - P0455 only.
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

P0442

DTC P0442 sets when the EVAP leak detection pump pressure sensor (gauge) vacuum reading is less than the 0.51 mm (0.020 in) reference orifice vacuum measurement plus a calibrated value for greater than 6 min.

P0455

DTC P0455 sets after a refueling event has been detected and the small/large leak diagnostics have not passed. If the EVAP leak detection pump pressure sensor (gauge) vacuum reading is less than the 0.51 mm (0.020 in) reference orifice vacuum measurement and times a calibrated value for greater than 6 min.

Action Taken When the DTC Sets

DTCs P0442 and P0455 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0442 and P0455 are Type B DTCs.

Diagnostic Aids

- The EVAP system can be filled with smoke more quickly and completely by injecting smoke at the purge tube and commanding the vent solenoid valve open. For example, when injecting smoke at the purge tube, remove the filler cap or temporarily leave the vent solenoid valve open until smoke is observed. Close the system and continue testing. If using a fuel cap adapter at the filler neck, disconnect the purge tube at the EVAP purge solenoid valve until smoke is observed.
- To help locate intermittent leaks using the **GE 41413-A** move all EVAP components while observing smoke with the **GE 41413-SPT** .
- To improve the visibility of the smoke exiting the EVAP system, observe the suspected leak area from different angles with a high intensity white light.
- If a small leak is difficult to find, it may be necessary to remove the EVAP components and test them one at a time using the adapters in the **GE 41413-300** .

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

WARNING: Refer to [Fuel and Evaporative Emission Pipe Warning](#) .

CAUTION: Refer to [Clean, Dry, Low Pressure Gas Source Caution](#) .

1. Verify the following conditions do not exist in the EVAP system:
 - Loose, incorrect, missing, or damaged fuel fill cap
 - A damaged EVAP purge solenoid
 - Disconnected, incorrectly routed, kinked, or damaged EVAP pipes and hoses
 - A damaged EVAP vent valve or EVAP canister
 - **If you find any of the above conditions**
Repair as necessary
 - **If none of the above are found**
2. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
3. Verify the DTC does not set.
 - **If the DTC sets**
Refer to Circuit/System Testing.
 - **If the DTC does not set**
4. All OK.

Circuit/System Testing

NOTE:

- The fuel sender may need to be accessed to inspect some of the EVAP system components.
- Larger volume fuel tanks and/or those with lower fuel levels may require several minutes for the floating indicator to stabilize.
- Introduce smoke at 15 s intervals while testing the system.
- Ensure that the vehicle underbody temperature is similar to the ambient

temperature and allow the surrounding air to stabilize before starting the diagnostic procedure. The system flow will be less with higher temperatures.

- **Refer to the GE 41413-A operation manual for detailed instructions in Evaporative Emission Control System Diagnosis.**

1. Disconnect the purge tube at the quick connector on the EVAP canister side of the purge solenoid valve and install the **CH 48096** .
2. Connect the **GE 41413-A** to the **CH 48096** .
3. Vehicle in Service Mode
4. Verify that there is no leak in the EVAP system using the flow meter on the **GE 41413-A** , calibrated to 0.51 mm (0.020 in).

- **If a leak is detected**

1. Apply smoke to the EVAP system at the service access port adapter with the **GE 41413-A** .
2. Locate the leak using the **GE 41413-SPT** .

- When the leak is located, repair or replace the affected component as necessary.

- **If no leak detected**

NOTE: **The steps below test for a restriction in the purge path.**

5. Connect the **GE 41413-A** nitrogen/smoke hose to the **J 41413-311** .
6. Disconnect the hose at the fuel cap end of the **GE 41415-30** and connect to the **J 41413-311** .
7. Install the **GE 41415-30** , filler neck end only, to the vehicle.
8. Vehicle in Service Mode
9. Command the EVAP Test ON with a scan tool.
10. Verify the vacuum/pressure gauge on the **GE 41413-A** and the scan tool Fuel Tank Pressure Sensor parameter both show vacuum.
 - **If the vacuum/pressure gauge shows vacuum but the Fuel Tank Pressure Sensor parameter does not show vacuum**

Replace the B150 Fuel Tank Pressure Sensor.
 - **If both do not show vacuum**

Repair the restriction in the purge path.
 - **If both show vacuum**
11. Verify that the Fuel Tank Pressure Sensor parameter increases to greater than 3.2 V, and the pressure values are similar between the scan tool Fuel Tank Pressure Sensor and the vacuum/pressure gauge on the **GE 41413-A** .

- **If not within the specified range**

Replace the B150 Fuel Tank Pressure Sensor.

- If within the specified range

12. All OK

Control	P0458	P0443	P0459

Circuit/System Description

The evaporative emission (EVAP) purge solenoid valve is used to purge fuel vapor from the EVAP canister to the intake manifold. The EVAP purge solenoid valve is pulse width modulated (PWM). Ignition voltage is supplied directly to the EVAP purge solenoid valve. The engine control module (ECM) controls the solenoid by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback

circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

- The vehicle is ON.
- The powertrain relay voltage is greater than 11 V.
- DTCs P0443, P0458 and P0459 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 5 s.

Action Taken When the DTC Sets

DTCs P0443, P0458 and P0459 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0443, P0458 and P0459 are Type B DTCs.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, command the EVAP Purge Solenoid Valve to 50% with a scan tool. You should hear the solenoid clicking.

- **No clicking heard**

Refer to Circuit/ System testing

- **Clicking heard**

2. Engine running, command the EVAP Purge Solenoid Valve from 0% to 50% and back to 0% with a scan tool.

3. Verify the scan tool parameters listed below do not display Malfunction.

- EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status
- EVAP Purge Solenoid Valve Control Circuit Open Test Status
- EVAP Purge Solenoid Valve Control Circuit Low Voltage Test Status

- **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

4. Verify the EVAP Purge Solenoid Valve Control Circuit parameters above do not display Malfunction when moving the related harnesses and connectors of the Q12 Evaporative Emission Purge Solenoid Valve.

- **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

6. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

7. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q12 Evaporative Emission Purge Solenoid Valve,

vehicle in Service Mode.

2. Verify that a test lamp illuminates between the ignition voltage circuit terminal B or 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition voltage circuit for a short and replace as necessary.
 - **If the test lamp illuminates**
3. Verify that a test lamp does not illuminate between the ignition circuit terminal B or 1 and the control circuit terminal A or 2.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
4. Remove the test lamp.
5. Verify the EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status parameter displays OK when commanding the EVAP Purge Solenoid Valve to 50% with a scan tool.
 - **If OK is not displayed**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If OK is displayed**
6. Install a 3 A fused jumper wire between the control circuit terminal A or 2 and the ignition circuit terminal B or 1.
7. Verify the EVAP Purge Solenoid Valve Control Circuit High Voltage Test Status parameter displays Malfunction when commanding the EVAP Purge Solenoid Valve to 50% with a scan tool.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω replace the K20 Engine Control Module.
 - **If Malfunction is displayed**

8. Test or replace the Q12 Evaporative Emission Purge Solenoid Valve.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the Q12 Evaporative Emission Purge Solenoid Valve.
2. Test for 10-30 Ω between the control terminal A or 2 and the ignition, terminal B or 1.
 - **If not between 10-30 Ω**

Replace the Q12 Evaporative Emission Purge Solenoid Valve.
 - **If between 10-30 Ω**
3. All OK.

Repair Instructions

Perform the [**Diagnostic Repair Verification**](#) after completing the repair.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0446: EVAPORATIVE EMISSION (EVAP) VENT SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0446

Evaporative Emission (EVAP) Vent System Performance

Typical Scan Tool Data

Fuel Tank Pressure Sensor Signal Voltage	Fuel Tank Pressure
2.67 V	Atmospheric Pressure/BARO
Less than 1.5 V	Positive Pressure
More than 1.5 V	Negative Pressure/Vacuum

Circuit/System Description

This DTC tests the evaporative emission (EVAP) system for a restricted or blocked EVAP vent path. There are two parts to this test.

- Part one uses the fuel tank pressure sensor to indicate vacuum comes within a calibrated range within a calibrated time.
- The second part of this test looks for excessive vacuum which would indicate a restriction. The duration of this second part of is a function of purge volume through the system.

The table listed below illustrates the relationship between the ON and OFF states, and the OPEN or CLOSED states of the EVAP purge and vent solenoid valves.

ECM Command	EVAP Purge Solenoid Valve	EVAP Vent Solenoid Valve
ON (Venting)	Open	Open, Venting
OFF (Not Venting)	Closed	Closed, Not Venting

Conditions for Running the DTC

- DTCs P00C8, P00C9, P00CA, P0068, P0071, P0072, P0073 P0090, P0091, P0092, P0442, P0443, P0449, P0451, P0452, P0453, P0455, P0458, P0459, P0461, P0462, P0463, P0497, P0498, P0499, P0502, P0503, P0606, P0722, P0723, P0191, P0192, P0193, P06A3, P06DB, P06D2, P06DE, P0A1D,

P0601, P0604, P0697, P145D, P145E, P160D, P160E, P1682, P16A0, P16A1, P16A2, P16A7, P16F3, P1104, P127A, P127C, P127D, P15F2, P1221, P2066, P2067, P2068, P2100, P2101, P2102, P2103, P2122, P2123, P2127, P2128, P2135, P2138, P215B, P2176, P2227, P2228, P2229, P2230, P228C, P228D, P2400, P2401, P2402, P2418, P2419, P2420, P2422, P2450, P24B9, P24BA, P24BB, U0073, U0074, U0293, U1817 are not set.

- The EVAP purge solenoid is open.
- The EVAP vent solenoid is open.
- The EVAP leak detection pump is OFF.
- The vehicle service mode voltage is greater than 11 V.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The outside air temperature is between 4 - 35°C (39 - 95°F).
- The engine RPM to enable is between 1500 - 3400.
- The engine RPM to re-enable is between 1500 - 3300.
- The engine vacuum to enable is between 15 - 56 kPa (2.1 - 8.1 PSI).
- The engine vacuum to re-enable is between 16 - 54 kPa (2.3 - 7.8 PSI).
- The engine airflow to enable is between 5 - 29 g/s.
- The engine airflow to re-enable is between 6 - 27 g/s.
- The purge flow to enable is greater than 0.17 g/s.
- The purge flow to re-enable is greater than 0.18 g/s.
- The purge duty cycle to enable is greater than 15%.
- The purge duty cycle to re-enable is greater than 16%.
- The requested purge flow to enable is greater than 2.94%.
- The delivered purge flow to re-enable is greater than 2.89%.
- The delivered purge flow to enable is greater than 2.06%.
- The engine is running.
- The purge is enabled.
- The refueling request button is not pressed.
- The device control is less than 0.5 s.
- The fuel tank protection is not active.

This test will start and run once per trip when propulsion system is active and engine is On.

DTC P0497 has run and passed.

Conditions for Setting the DTC

If fuel tank pressure sensor reading is less than -13 in H₂O (-3.24 kPa) of vacuum for 5 s

Action Taken When the DTC Sets

DTC P0446 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0446 is a Type B DTC.

Diagnostic Aids

An intermittent condition could be caused by:

- A damaged EVAP vent housing
- A temporary blockage at the EVAP vent solenoid valve inlet
- Pinched vent hose
- A blockage in the vent system may also cause a poor fuel fill problem.

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

1. Vehicle in Service Mode
2. Verify DTC P0449 is not set.

- **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If the DTC is not set**

3. Vehicle OFF, remove the fuel tank filler cap. Vehicle in Service Mode.
4. Verify that the Fuel Tank Pressure Sensor voltage parameter is between 2.0 - 3.0 V.

- **If not between the 2.0 - 3.0 V**

Refer to [DTC P0451-P0453](#).

- **If between the 2.0 - 3.0 V**

5. Install the fuel tank filler cap, engine Running at operating temperature for 5 min,
6. Verify the scan tool Fuel Tank Pressure Sensor parameter does not increase to greater than 0.29 V when commanding the EVAP Purge Solenoid Valve to 50%.

- **If greater than 2.5 V**

Refer to Circuit/System Testing.

- **If 2.5 V or less**

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

NOTE: Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.

1. Verify a blockage or restriction does not exist in the EVAP system components listed below.
 - Evaporative Emission Vent System Hoses
 - Evaporative Emission Canister
 - Q13 Evaporative Emission Vent Solenoid Valve
 - Evaporative Emission Vent Filter
 - **If a condition exists**

Repair or replace the component as necessary

- **If none of the conditions exist**

2. Reconnect all previously disconnected EVAP hardware.

NOTE: Refer to the **GE-41413-A** operation manual for detailed instructions in **Evaporative Emission Control System Diagnosis**.

3. Remove the fuel fill cap and connect the **CH-41415-30** to the fuel tank filler neck. Connect the **GE-41413-A** to the **CH-41415-30**.

4. Turn the nitrogen/smoke valve on the **GE-41413-A** to nitrogen.

NOTE: **DO NOT** exceed the specified value in this step. Exceeding the specified value may produce incorrect test results.

5. Use the remote switch to activate the **GE-41413-A** and pressurize the fuel tank to 5.0 in H₂O (1.24 kPa).

6. Vehicle in Service Mode

7. Verify the scan tool Fuel Tank Pressure Sensor parameter is 0 in H₂O (0 kPa) when commanding the EVAP Vent Solenoid Valve to ON (Venting).

- **If not 0 in H₂O**

Test for a blockage or a restriction in the EVAP vent hose or inlet. If the inlet or hose test normal, replace the Q13 Evaporative Emission Vent Solenoid Valve.

- **If 0 in H₂O**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to step 1 above.

- **If the DTC does not set**

9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Evaporative Emission Canister Replacement**
- Refer to **Evaporative Emission Canister Vent Solenoid Valve Replacement**
- Refer to **Fuel Tank Pressure Sensor Replacement**

DTC P0449, P0498, OR P0499: EVAPORATIVE EMISSION (EVAP) VENT SOLENOID VALVE CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0449

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit

DTC P0498

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit Low Voltage

DTC P0499

Evaporative Emission (EVAP) Vent Solenoid Valve Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P0498	P0449, P0498	-
Control	P0498	P0449	P0499

Circuit/System Description

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. Battery voltage is supplied to the normally closed evaporative emission (EVAP) vent solenoid valve. The ECM grounds the EVAP vent solenoid valve control circuit through an internal switch called a driver. The ECM monitors the status of the driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

Conditions for Running the DTC

DTCs P0449, P0498 and P0499 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P0449, P0498 and P0499 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0449, P0498 and P0499 are Type B DTCs.

Diagnostic Aids

Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.

Circuit/System Verification

1. Vehicle in Service Mode, command the EVAP vent solenoid valve to Venting and Not Venting with a scan tool. Listen or feel for a click when the valve operates.
 - **No click heard or felt**

Refer to Circuit/System testing
 - **Click heard or felt**
2. Command the EVAP Vent Solenoid Valve to Venting and Not Venting with a scan tool
3. Verify the following scan tool parameters listed below do not display Malfunction :
 - EVAP Vent Solenoid Valve Output Circuit High Voltage Test Status
 - EVAP Vent Solenoid Valve Output Circuit Open Test Status
 - EVAP Vent Solenoid Valve Output Circuit Low Voltage Test Status
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.
2. Vehicle in Service Mode.
3. Verify that a test lamp illuminates between the B+ circuit terminal A or 2 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the B+ circuit for a short and replace as necessary.

- **If the test lamp illuminates**

4. Verify that a test lamp does not illuminate between the B+ circuit terminal A or 2 and the control circuit terminal B or 1.

- **If the test lamp illuminates**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

5. Remove the test lamp.
6. Verify the scan tool EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status parameter displays OK when commanding the EVAP Vent Solenoid Valve to Venting with a scan tool.

- **If OK is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If OK is displayed**

7. Install a 3 A fused jumper wire between the control circuit terminal B or 1 and the B+ circuit terminal A or 2.
8. Verify the scan tool EVAP Vent Solenoid Valve Control Circuit High Voltage Test Status parameter displays Malfunction when commanding the EVAP Vent Solenoid Valve to Venting with a scan tool.

- **If Malfunction is not displayed**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω replace the K20 Engine Control Module.

- **If Malfunction is displayed**

9. Test or replace the Q13 Evaporative Emission Vent Solenoid Valve.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.
2. Test for 10-30 Ω between the control terminal B or 1 and the B+ circuit terminal A or 2.

- **If not between 10-30 Ω**

Replace the Q13 Evaporative Emission Vent Solenoid Valve.

- **If between 10-30 Ω**

3. Test for no air flow through the Q13 Evaporative Emission Vent Solenoid Valve by applying vacuum to the pump side of the valve. It should hold 1 - 2 in. Hg (3 - 7 kPa) for 30 s.

- **If not within the specified range**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If within the specified range**

4. Jumper:
 - The control terminal B or 1 to ground
 - The B+ circuit terminal A or 2 to 12 V battery voltage
5. Apply vacuum to the pump side of the Q13 Evaporative Emission Vent Solenoid Valve. It should not hold vacuum.
 - **If it does hold vacuum**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If it does not hold vacuum**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P0451-P0453: FUEL TANK PRESSURE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Typical Scan Tool Data

Fuel Tank Pressure Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Vehicle in Service Mode			

Circuit	Short to Ground	Open	Short to Voltage
Parameter Normal Range: 0.15 - 4.85 V			
5 V Reference	0 V	0 - 1.5 V	5 V
Signal	0 V	0 V	3 - 5 V
Low Reference	-	4 - 5 V	-

Circuit/System Description

The fuel tank pressure sensor measures the pressure or vacuum in the evaporative emission (EVAP) system. The engine control module (ECM) supplies a 5 V reference and a low reference circuit to the fuel tank pressure sensor. The fuel tank pressure sensor signal voltage varies depending on EVAP system pressure or vacuum.

The following tables illustrate relationship examples between the fuel tank pressure sensor and the ON and OFF states, and the OPEN or CLOSED states of the EVAP components.

Fuel Tank Pressure Relationship

Fuel Tank Pressure	Fuel Tank Pressure in. H2O/PSI	Fuel Tank Pressure Signal Voltage
Pressure	Positive Value, 14.9 in H2O/0.54 PSI	High, 4.73 V
No Pressure	Near Zero, 0 in H2O/0.001 PSI	2.6 V
Vacuum	Negative Value, - 2.37 in H2O/- 0.08 PSI	Low, 2.3 V

Fuel Tank Pressure to EVAP Leak Detection Pump Assembly Relationship

Fuel Tank Pressure	Fuel Tank Pressure Sensor	EVAP Leak Detection Pump Switch Valve	Vent Valve	EVAP Leak Detection Pump Pressure
Pressure or Vacuum	Positive or Negative Value	Vent	Closed	100 kPa (14.50 PSI) *
Vacuum	Negative Value -1 kPa (0.15 PSI)	Pump/Not Venting	Open	99 kPa (14.36 PSI) **
Pressure	Positive Value -3 kPa (0.44 PSI)	Pump/Not Venting	Open	103 kPa (14.94 PSI) **

* Equivalent to barometric pressure reading.

** The values are examples only. Your readings may vary from this depending on the pressure or vacuum in the system and barometric pressure.

Conditions for Running the DTC

P0451 - Condition 1:

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, U0140, U182D, U0073, U0074, P2537 or P2610 is not set.

- DTC P1458 or P145D are not present when the test failed this ignition cycle.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The engine coolant temperature (ECT) is less than 40°C (104°F).
- The intake air temperature (IAT) is between 4°C - 45°C (39°F - 113°F).
- The propulsion system is not active.
- The vehicle is OFF.
- The service bay test is not active.
- The refueling request button is not pressed.
- The battery voltage is greater than 10 V.
- The vehicle speed is less than 1.6 km/h (1 MPH).
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 h.
- The DTC runs once per drive cycle and immediately after a code clear when the above conditions are met.

P0451 - Condition 2:

- DTCs P0068, P0071, P0072, P0073, P010C, P010D, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P012B, P012C, P012D, P0121, P0122, P0123, P0222, P0223, P0442, P0443, P0449, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0722, P0723, P0606, P1104, P1221, P145A, P145D, P145E, P1458, P1459, P16F3, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422 or P2450 is not set.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The outside air temperature (OAT) is between 4°C - 35°C (39 - 102°F).
- The engine is running.
- The run/crank voltage is greater than 11 V.
- The EVAP Purge solenoid valve is not enabled.
- The refueling request button is not pressed.
- The DTC runs once per drive cycle when the above conditions are met.

P0452 and P0453

- Vehicle ON or the engine is running.
- DTCs P0452 and P0453 run continually when the above conditions are met.

Conditions for Setting the DTC

P0451

The ECM detects the difference between the fuel tank pressure sensor and the EVAP leak detection pump pressure is greater than 0.747 kPa (0.11 PSI) for greater than 5 s.

P0452

The ECM detects the fuel tank pressure sensor voltage is less than 0.15 V for greater than 8 s.

P0453

The ECM detects the fuel tank pressure sensor voltage is greater than 4.85 V for greater than 8 s.

Action Taken When the DTC Sets

DTCs P0451, P0452 and P0453 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0451, P0452 and P0453 are Type B DTCs.

Diagnostic Aids

- A restriction in the EVAP canister or vent lines that keeps the fuel tank pressure and EVAP leak detection pump sensor from comparing each others value.
- Since this is a sealed system there could be a pressure or vacuum existing in the system.
- A vent valve stuck closed will affect performance.
- A switching valve stuck in the vent position will affect performance.
- Ensure that the reference port on the fuel tank pressure sensor is unobstructed.
- In a sealed system a condition where there is a lot of pressure or vacuum in the fuel tank to start with (fuel tank pressure sensor is outside readable range), in those cases (high vacuum) you will not see any fuel tank pressure sensor movement after purge is commanded on. On the pressure side, it may eventually get into the readable range, but could take significant time. Opening/venting the vent solenoid before testing can relieve any stored pressure or vacuum to help alleviate this.
- A fuel tank pressure sensor that is skewed or does not have a linear transition from low to high may cause these DTC's to set. Scan tool output controls and Review Stored Data can help detect erratic sensor response. To test the sensor signal under vacuum conditions, use Review Stored Data and the EVAP Test function to capture data while commanding purge to 20%, then review stored data to look for erratic sensor operation. A similar test can be done for the pressure side of the sensor operation by applying pressure with the **GE 41413-A** while taking a snapshot.

Special Tools

GE 41413-A Evaporative Emissions System Tester

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

[Circuit/System Verification](#)

NOTE:

- The order of these steps is important. If not followed properly you will be bleeding off any pressure or vacuum in the system and not see any change in the EVAP leak detection pump sensor.
- Read the instructions for P0451 in their entirety before proceeding to understand what is being required.
- Ambient and vehicle component temperature must be above 0Â°C (32Â°F) to command the switching valve or vacuum pump. This prevents erroneous results and damage to the EVAP leak detection pump assembly.

P0451

1. Verify DTC P0449, P0498 or P0499 is not set

- **If the DTC sets**

Refer to: [DTC P0449, P0498, or P0499](#)

- **If the DTC does not set**

2. Verify DTC P0452 or P0453 is not set

- **If the DTC sets**

Refer to Circuit/System Testing

- **If the DTC does not set**

3. Vehicle in Service Mode.
4. Record the scan tool Fuel Tank Pressure Sensor parameter, pressure or vacuum.
5. Command the EVAP Vent Solenoid Valve to Venting.
6. The Fuel Tank Pressure Sensor parameter should be 0.07 in H₂O, 0.01 kPa (0.00 PSI) after 5 s.

- **If not within the specified range**

Verify the following conditions do not exist:

- A restriction in the EVAP canister or vent lines
- A EVAP vent solenoid valve stuck closed
- The reference port on the fuel tank pressure sensor is obstructed

Repair or replace as necessary

- **If within specified range**

7. Command the EVAP leak detection pump ON using the scan tool EVAP Test. Get the fuel tank pressure sensor parameter to -11.56 in H₂O, -2.88 kPa (-0.42 PSI) or greater. This may take several seconds.

NOTE: Use of any control function other than EVAP Test will not create a vacuum in the system.

NOTE: Vacuum will decay exiting the EVAP Test and going to step 8. This is normal. There should be sufficient vacuum left to perform steps 8 and 9.

8. Record the scan tool EVAP Leak Detection Pump and Fuel Tank Pressure Sensor parameters, reading one.
9. Perform each step listed below in order:
 1. Select scan tool Fuel Tank Pressure Sensor Test.
 2. Command the EVAP Leak Detection Pump Switching Valve Command to Not Venting.
 3. Wait for 3 s.
 4. Command the EVAP Vent Solenoid Valve Command ON.

NOTE: Wait for 15 s while observing the parameters then click the pause button on the scan tool to retain the parameters.

10. Record the scan tool EVAP Leak Detection Pump and Fuel Tank Pressure Sensor parameters, reading two.
11. Press the scan tool Release Control button after recording the parameters.

NOTE: The subtraction results and Fuel Tank Pressure parameter should be negative since a vacuum was pulled on the system.

12. Subtract the EVAP leak detection pump reading 2 from EVAP leak detection pump reading 1. This value equals what the fuel tank pressure sensor, reading two, should be (EVAP leak detection pump reading 2 -

EVAP leak detection pump reading 1 = fuel tank pressure reading 2). The fuel tank pressure sensor should be within 3 in H₂O, 0.749 kPa (0.11 PSI) of the subtraction just performed.

- **If not within the specified range**

Verify the following conditions do not exist:

- A restriction in the EVAP canister or vent lines
- A EVAP vent solenoid valve stuck closed
- The reference port on the fuel tank pressure sensor is obstructed

Repair or replace as necessary

- **If within the specified range**

13. All OK.

P0452 and P0453

1. Request a refueling event.
2. Remove the fuel cap.
3. Vehicle in Service Mode.
4. Verify the scan tool Fuel Tank Pressure Sensor parameter. It should be 2.67 V at 0 kPa (0 PSI).

- **If not within the specified range**

Refer to circuit/system testing.

- **If within the specified range**

5. All OK.

Circuit/System Testing

NOTE: Testing for steps 2 - 6 is performed on the ECM side of the harness connector.

1. Vehicle OFF, all systems OFF. Disconnect the harness connector at the B150 Fuel Tank Pressure Sensor. It may take up to for 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 3 and ground.
 - **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
5. Verify the scan tool Fuel Tank Pressure parameter is less than 0.2 V.
 - **If 0.2 V or greater**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode
2. Test for less than 1 V between the signal circuit terminal 1 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 0.2 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the 5 V reference circuit terminal 3.
7. Verify the scan tool Fuel Tank Pressure Sensor parameter is greater than 4.7 V.
 - **If 4.7 V or less**
1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 4.7 V**
8. Test or replace the B150 Fuel Tank Pressure Sensor.

Component Testing

1. Remove the Q63 Evaporative Emission System Leak Detection Pump Assembly
2. Verify none of the conditions listed below exist:

- Poor connection at the X350 or X351 harness connectors
- Open or shorted 5 V reference circuit
- Open or shorted sensor signal circuit
- Open low reference circuit
- **If a condition exists**

Repair as necessary.

- **If no conditions exist**

3. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Tank Pressure Sensor Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P0497: EVAPORATIVE EMISSION (EVAP) SYSTEM NO FLOW DURING PURGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0497

Evaporative Emission (EVAP) System No Flow During Purge

Circuit/System Description

This DTC tests for proper intake manifold vacuum flow to the evaporative emission (EVAP) system. The engine control module (ECM) opens the EVAP purge solenoid valve and the EVAP vent solenoid valve. The ECM then monitors the fuel tank pressure sensor and EVAP leak detection pump pressure sensor to determine if a vacuum is being drawn on the EVAP system. If vacuum in the EVAP system is less than a predetermined value within a predetermined time, this DTC sets.

Conditions for Running the DTC

- DTCs P0068, P0071, P0072, P0073, P0106, P0107, P0108, P0122, P0123, P0222, P0223, P0442, P0443, P0449, P0451, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0606, P0722, P0723, P16F3, P1104, P145D, P145E, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422, P2450, P24B9, P24BA and P24BB is not set.
- The EVAP purge solenoid is open.
- The EVAP vent solenoid is open.
- The EVAP leak detection pump is OFF.

- The vehicle service mode voltage is greater than 11 V.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The outside air temperature is between 4 - 35°C (39 - 95°F).
- The engine RPM to enable is between 1500 - 3400.
- The engine RPM to re-enable is between 1500 - 3300.
- The engine vacuum to enable is between 15 - 56 kPa (2.1 - 8.1 PSI).
- The engine vacuum to re-enable is between 16 - 54 kPa (2.3 - 7.8 PSI).
- The engine airflow to enable is between 5 - 29 g/s.
- The engine airflow to re-enable is between 6 - 27 g/s.
- The purge flow to enable is greater than 0.17 g/s.
- The purge flow to re-enable is greater than 0.18 g/s.
- The purge duty cycle to enable is greater than 15%.
- The purge duty cycle to re-enable is greater than 16%.
- The requested purge flow to enable is greater than 2.94%.
- The delivered purge flow to re-enable is greater than 2.89%.
- The delivered purge flow to enable is greater than 2.06%.
- The engine is running.
- The purge is enabled.
- The refueling request button is not pressed.
- The device control is less than 0.5 s.
- The fuel tank protection is not active.

This test will start and run once per trip with propulsion system active and engine is ON.

Conditions for Setting the DTC

- After an initial time delay of 3 s when the fuel tank pressure sensor reading is greater than 0.39 kPa (0.056 PSI).

Or

- After an initial time delay of 3 s when the fuel tank pressure sensor reading is less than 0.39 kPa (0.056 PSI), plus an EVAP leak detection pump switching valve delay time of 0.2 s.
- If the EVAP leak detection pump pressure sensor, gauge, indicates a vacuum change less than 2 kPa (0.29 PSI) for 20 s, then a low purge flow failure has been detected.

Action Taken When the DTC Sets

DTC P0497 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P0497 is a Type B DTC.

Diagnostic Aids

- A temporary blockage in the components listed below could cause an intermittent condition.
 - EVAP purge solenoid valve
 - Purge pipe
 - EVAP canister
- A EVAP vent solenoid valve stuck closed can cause this DTC to set.
- A EVAP leak detection pump switching valve stuck in the vent or pump position can cause this DTC to set.
- A fuel tank fuel pump module assembly not fully seated in the fuel tank can cause this DTC to set.
- A loose fuel cap can cause this DTC to set.

Special Tools

- **CH-48096** EVAP Service Access Port Tool
- **GE-41413-A** Evaporative Emissions System Tester

- **GE-41413-300** EVAP Cap And Plug Kit
- **GE-41413-SPT** High Intensity White Light

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

WARNING: Refer to [Fuel and Evaporative Emission Pipe Warning](#) .

CAUTION: Refer to [Clean, Dry, Low Pressure Gas Source Caution](#) .

NOTE: Refer to **GE-41413-A** operation manual for detailed instructions in **Evaporative Emission Control System Diagnosis**.

1. Verify the following conditions do not exist in the EVAP system:

- A loose, missing, or damaged fuel fill cap.
- A stuck closed, blocked, or restricted EVAP purge solenoid valve.
- A blockage or restriction in the EVAP purge solenoid valve vacuum supply hose, purge pipe, EVAP canister or vapor pipe.

- **If a condition is found**

Repair or replace as necessary.

- **If no conditions are found**

CAUTION: Refer to [Fuel and Evaporative Emission Hose/Pipe Connection Cleaning Caution](#) .

2. Connect the **CH-48096** to the EVAP purge solenoid valve.

3. Connect the **GE-41413-A** to **CH-48096**

4. Disconnect the fresh air intake tube from the EVAP leak detection pump.

5. Plug the fresh air port of the EVAP leak detection pump

6. Engine running, observe the **GE-41413-A** vacuum gauge and Fuel Tank Pressure parameter with a scan tool. There should be vacuum present.

- **If no vacuum is detected**

Refer to Circuit System Testing

- **If vacuum is detected**

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to Circuit System Testing

- **If the DTC does not set**

8. All OK.

Circuit/System Testing

NOTE: Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.

1. The **GE-41413-A** should still be installed from verification.
2. Engine running, observe the vacuum gauge while commanding the EVAP Purge Solenoid Valve to Increase with the scan tool. Vacuum should be present from 10 - 100%.

- **If no vacuum is present**

Test or replace the Q12 Evaporative Emission Purge Solenoid Valve.

- **If vacuum is present**

3. Install the plug in the fresh air port performed in step 5 of circuit system verification.
4. Observe the Fuel Tank Pressure parameter while commanding the EVAP Purge Solenoid Valve to Increase with the scan tool. The parameter should be greater than 1.50 V within 60 s.

- **If less than the specified range**

Repair the blocked purge path or test or replace the Q12 Evaporative Emission Purge Solenoid Valve.

- **If within specified range**

5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Evaporative Emission Canister Purge Solenoid Valve Replacement**
- Refer to **Evaporative Emission Canister Vent Solenoid Valve Replacement**
- Refer to **Evaporative Emission Canister Replacement**
- Refer to **Evaporative Emission System Vacuum Leak Detection Pump Replacement**

DTC P050D: COLD START ROUGH IDLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P050D

Cold Start Rough Idle

Circuit/System Description

During a cold start, the engine control module (ECM) commands dual-pulse mode during Open Loop operation to improve cold start emissions. In dual-pulse mode, the injectors are energized twice during each injection event. As with misfire diagnosis, in dual-pulse mode the ECM monitors the crankshaft position sensor and the camshaft position sensors to calculate crankshaft rotation speed. In normal operation, optimum fuel delivery during dual-pulse mode produces a steady crankshaft rotation speed. If the variations exceed a calibrated value, the code will be set.

Conditions for Running the DTC

- DTCs P0010, P0011, P0013, P0014, P0020, P0021, P0023, P0024, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0101-P0103, P0106-P0108, P010B, P010C, P010D, P0112, P0113, P0117, P0118, P0119, P0122, P0123, P0128, P0192, P0193, P0201-P0204, P0205, P0206, P0207, P0208, P0222, P0223, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0273, P0274, P0276, P0277, P0279, P0280, P0282, P0283, P0335, P0336, P0351-P0354, P0355, P0356, P0357, P0358, P0502, P0503, P0506, P0507, P05CC, P05CD, P05CE, P05CF, P0627, P0628, P0629, P0697, P06A3, P0722, P0723, P0806, P0807, P0808, P111E, P1248, P1249, P124A, P127C, P127D, P124B, P128A, P128B, P128F, P16A0, P16A1, P16A2, P16E4, P16E5, P16F3, P182E, P1824, P182A, P182B, P182C, P182D, P182F, P1838, P1839, P1840, P1841, P18B5, P18B6, P18B7, P18B8, P18B9, P18BA, P18BB, P18BC, P18BD, P18BE, P18BF, P18C0, P18C1, P18C2, P18C3, P1915, P2088, P2089, P2090, P2091, P2092, P2093, P2094, P2095, P2122, P2123, P2127, P2128, P2135, P2138, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P216B, P216C, P216E, P216F, P217B, P217C, P217E, P217F, P1248, P1249, P124A, P124B, P124C, P124D, P124E, P124F, P2300, P2301, P2303, P2304, P2306, P2307, P2309, P2310, P2312, P2313, P2315, P2316, P2318, P2319, P2321, P2322 are not set.
- The catalyst temperature is less than 350Â°C (662Â°F).
- The engine coolant temperature is between -15 - 56Â°C (5 - 132.8Â°F).
- The barometric pressure is greater than 76 kPa.
- The engine speed is between 450 - 2200 RPM.
- The accelerator pedal position is less than 110%.
- The engine is running for less than 30 s and a cold start has been detected.
- The DTC runs once per cold start.

Conditions for Setting the DTC

This DTC will set if the ECM detects variations in crankshaft rotation speed caused by the lack of adequate fuel delivery during dual-pulse mode.

Action Taken When the DTC Sets

- DTC P050D is a Type B DTC.
- The ECM disables dual pulse mode and energizes the fuel injector as it would for a warm engine.

Conditions for Clearing the DTC

DTC P050D is a Type B DTC.

Diagnostic Aids

- This DTC may be set with a misfire DTC, however the existence of this DTC is a higher priority and indicates the condition to diagnose is related to fuel and/or injectors, not the ignition/spark system.
- A restricted fuel injector may cause this DTC to set.
- High resistance in the circuits of the injectors could set this DTC without setting an injector DTC. Test the injector circuits of the affected cylinders for a high resistance if you suspect a condition.
- A drop in system voltage during cold start may set this DTC.

Circuit/System Verification

NOTE: **Circuit/System Verification requires cold start. Do not start vehicle prior to connecting scan tool and preparing to evaluate the condition during engine crank.**

1. Engine running.
2. Verify that the scan tool Cylinder 1-4 Current Misfire Counters are not incrementing during first 500 engine cycles.

- **If incrementing**

Refer to Circuit/System Testing.

- **If not incrementing**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

4. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Verify that the fuel pressure is not too low or too high. Refer to [Fuel System Diagnosis](#).

- **If a condition is found**

Repair or replace components as necessary

- **If a condition is not found**

2. Verify that the fuel is not contaminated. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).

- **If the fuel is contaminated**

Clean the fuel system. Refer to [Fuel System Cleaning](#).

- **If the fuel is not contaminated**

3. Replace the appropriate fuel injectors as indicated by high misfire counts.

Repair Instructions

NOTE: Repair Verification requires cold start.

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Fuel Injector Replacement](#)

DTC P057B-P057E: BRAKE PEDAL POSITION SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

Circuit/System Description

The brake pedal position (BPP) sensor is part of the engine brake pedal override feature. The engine control module (ECM) continuously monitors the vehicle speed and the position of the brake pedal. These two main inputs, along with other ECM inputs are used to determine if the vehicle is decelerating at the proper speed and rate with the brake pedal applied. When the engine brake pedal override system is active, the ECM reduces engine torque to assist in reducing vehicle speed.

The BPP sensor is a six wire sensor, and is part of a dual brake position sensor. One BPP Sensor is used for the stop lamps and the other BPP Sensor is used for the engine brake pedal override feature. The BPP Sensor for engine brake pedal override communicates with the ECM. The ECM supplies a 5 V reference circuit, low reference circuit, and signal circuit to the BPP sensor. The BPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage greater than 0.25 V when the brake

pedal is released to a voltage less than 4.75 V when the brake pedal is fully applied.

For information on the Stop Lamps side of the BPP Sensor, refer to [Exterior Lighting Systems Description and Operation](#) .

Conditions for Running the DTC

P057B

- DTCs P057C, or P057D are not set.
- Ignition voltage is greater than 10 V.
- Shift lever has been in Park at least once during key ON.
- Shift lever is not in Park.
- Vehicle speed is greater than 8 Km/h (5 mph).
- Accelerator Pedal Position is less than 5%.
- DTC runs once per key cycle when above conditions are met.

P057C, P057D, or P057E

- Ignition voltage is greater than 10 V.
- DTC runs continuously when above condition is met.

Conditions for Setting the DTC

P057B

ECM detects the BPP sensor signal is stuck in a range for greater than 1 s.

P057C

ECM detects the BPP sensor voltage is less than 0.25 V greater than 1 s.

P057D

ECM detects the BPP sensor voltage is greater than 4.75 V greater than 1 s.

P057E

ECM detects the BPP sensor value varies greater than a calibrated value.

Action Taken When the DTC Sets

- P057B, P057C, P057D, and P057E are Type A DTCs.
- Brake Pedal Position Sensor parameter defaults to 0%.

Conditions for Clearing the DTC

P057B, P057C, P057D, and P057E are Type A DTCs

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

NOTE: The Brake Pedal Position sensor scan tool data is located in the ECM automatic transmission data list.

1. Vehicle in Service Mode.
2. Verify DTC P0641, P0651, P0697, or P06A3 is not set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

3. Transmission in Park, and service brake pedal released.
4. Verify the scan tool Brake Pedal Position Sensor parameter in the ECM displays released.

- **If released is displayed**

Refer to Circuit/System Testing.

- **If released is not displayed**

5. Verify the scan tool Brake Pedal Position Sensor parameter changes as the brake pedal is applied and displays applied on a scan tool when the brake pedal is fully applied.

- **If applied is displayed**

Refer to Circuit/System Testing.

- **If applied is not displayed**

6. Verify the scan tool Brake Pedal Position Sensor Learned Release Position parameter is within 0.1 V of the Brake Pedal Position Sensor parameter when the brake pedal is fully released.

- **If difference is greater than 0.1 V**

Perform the **Brake Pedal Position Sensor Learn** .

- **If difference is 0.1 V or less**

7. Verify the Brake Pedal Position Sensor parameter transitions smoothly without any spikes or dropouts when slowly applying and releasing the brake pedal.

- **If parameter does not transition smoothly or has spikes or dropouts**

Refer to Circuit/System Testing.

- **If parameter transitions smoothly and there are no spikes or dropouts**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

9. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

10. All OK.

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification first.

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor. It may take up to 2 minutes for all vehicle systems to power down.

NOTE: All terminal references are for the vehicle harness brake pedal position sensor connector.

2. Test for less than 10 Ω between the low reference circuit terminal 6 and ground.

- **If 10 Ω or greater**

1. Disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 10 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 5 and ground.

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle ON.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Verify the scan tool Brake Pedal Position Sensor parameter is released.

- **If released is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle ON.
2. Test for less than 0.25 V between the signal circuit terminal 4 and ground.
 - If 0.25 V or greater, repair the short to voltage on the circuit.
 - If less than 0.25 V, replace the K20 Engine Control Module.

- **If released is displayed**

6. Install a 3 A fused jumper wire between the signal circuit terminal 4 and the 5 V reference circuit terminal 5.

7. Verify the scan tool Brake Pedal Position Sensor parameter is applied.

- **If applied is not displayed**

1. Vehicle OFF, remove the jumper wire, and disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit terminal 4 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance.
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If applied is displayed**

8. Replace the B22 Brake Pedal Position Sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Brake Pedal Position Sensor Replacement](#)
- Perform the [Brake Pedal Position Sensor Learn](#) following the replacement of the ECM or BPP sensor, or any repair that effects the BPP sensor alignment.
- Refer to [Control Module References](#) for Engine Control Module replacement, programming and setup.

DTC P0601-P0604, P0606, P062B, P062F, P0630, P16F3, OR P262B: CONTROL MODULE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Control Module Long Term Memory Reset

DTC P0604

Control Module Random Access Memory Performance

DTC P0606

Control Module Processor Performance

DTC P062B

Control Module Fuel Injector Control Performance

DTC P062F

Control Module Long Term Memory Performance

DTC P0630

VIN Not Programmed or Mismatched - Engine Control Module (ECM)

DTC P16F3

Control Module Redundant Memory Performance

DTC P262B

Control Module Power Off Timer Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). This diagnostic also addresses if the ECM is not programmed.

The ECM monitors its ability to read and write to the memory. It also monitors a timing function.

Conditions for Running the DTC

P0601, P0602, P0630

- The vehicle is ON.
- These DTCs run continuously when the above condition is met.

P0603, P062F

- The vehicle is ON.
- These DTCs run once per ignition cycle.

P0604

- The vehicle is ON for greater than 30 s.
- DTC P0604 runs continuously when the above condition is met.

P0606, P062B

- The system voltage is greater than 11 V.
- DTC P0606 runs continuously when the above condition is met.

P16F3

- The engine is running.
- DTCs P0101, P0102, P0103, P0106, P0107, or P0108 are not set.
- DTC P16F3 runs continuously when the above conditions are met.

P262B

- Vehicle OFF.
- The ECM is not powered down.
- DTC P262B runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects an internal failure or incomplete programming for more than 10 s.

Action Taken When the DTC Sets

- DTCs P0601, P0602, P0603, P0604, P0606, P0630, and P16F3 are Type A DTCs.

- DTCs P062F and P262B are Type B DTCs.

Conditions for Clearing the DTC

- DTCs P0601, P0602, P0603, P0604, P0606, P0630, and P16F3 are Type A DTCs.
- DTCs P062B, P062F and P262B are Type B DTCs.

Diagnostic Aids

Low voltage or a momentary loss of power or ground to the ECM may cause a DTC to set. Verify the following:

- The battery cables are clean and tight, and the battery is fully charged. Refer to **Battery Inspection/Test**
- The ECM ground circuits do not have an open or high resistance.
- The ECM power circuits do not have an open, short to ground, or high resistance.

Circuit/System Verification

1. Vehicle in Service Mode, clear the DTC information with a scan tool.

2. Verify no other DTCs are set.

- **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If no other DTCs are set**

3. Verify DTC P0602 or P0630 is not set.

- **If any of the DTCs are set**

1. Program the K20 Engine Control Module. Refer to [Control Module References](#).

2. Verify DTC P0602 or P0630 is not set.

- If any of the DTCs are set, replace the K20 Engine Control Module.
- If none of the DTCs are set

3. All OK.

- **If none of the DTCs are set**

4. Verify DTC P0601, P0603, P0604, P0606, P062B, P062F, P16F3, or P262B is not set.

- **If any of the DTCs are set**

Replace the K20 Engine Control Module.

- **If none of the DTCs are set**

5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for control module replacement, programming, and setup.

DTC P0627-P0629: FUEL PUMP ENABLE CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0627

Fuel Pump Enable Circuit

DTC P0628

Fuel Pump Enable Circuit Low Voltage

DTC P0629

Fuel Pump Enable Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	P0171, P0506, P0628, P12A6	P0171, P0506, P0627, P12A6	P0629, P12A6	P12A6

Circuit/System Description

The engine control module (ECM) provides ignition voltage to the fuel pump driver control module whenever the engine is cranking or running. The ECM enables the fuel pump driver control module as long as the engine is cranking or running, and ignition system reference pulses are received. While this enable voltage is being received, the fuel pump driver control module supplies a varying voltage to the in-tank fuel pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

- The engine speed is greater than 0 RPM.
- The ignition voltage is greater than or equal to 11 V.
- The fuel pump enable circuit is commanded ON.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for 2.5 s.

Action Taken When the DTC Sets

DTCs P0627, P0628, and P0629 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P0627, P0628, and P0629 are Type B DTCs.

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify DTC P0627, P0628, or P0629 is not set.
 - **If a DTC is set**

Refer to Circuit/System Testing.
 - **If a DTC is not set**
3. Verify the parameters listed below do not display Malfunction when commanding the Fuel Pump Enable On and Off with a scan tool.
 - Fuel Pump Enable Circuit Low Voltage Test Status
 - Fuel Pump Enable Circuit Open Test Status
 - Fuel Pump Enable Circuit High Voltage Test Status
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.
 - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
6. All OK.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the K111 Fuel Pump Driver Control Module harness connector.
2. Vehicle in Service Mode for greater than 10 s.
3. Verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.

- **If the test lamp illuminates**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

4. Remove the test lamp.
5. Verify the scan tool Fuel Pump Enable Circuit Low Voltage Test Status parameter is OK when commanding the Fuel Pump Enable On with a scan tool.

- **If OK is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If OK is displayed**

6. Install a 3 A fused jumper wire between the control circuit terminal 2 and ground.
7. Verify the scan tool Fuel Pump Enable Circuit Low Voltage Test Status parameter is Malfunction when commanding the Fuel Pump Enable On with a scan tool.

- **If Malfunction is not displayed**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If Malfunction is displayed**

8. Test or replace the K111 Fuel Pump Driver Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for Engine Control Module and Fuel Pump Power Control Module replacement, programming, and setup

DTC P0641, P0651, P0697, P06A3, OR P06D2: 5 V REFERENCE 1-5 CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P0641

5 V Reference 1 Circuit

DTC P0651

5 V Reference 2 Circuit

DTC P0697

5 V Reference 3 Circuit

DTC P06A3

5 V Reference 4 Circuit

DTC P06D2

5 V Reference 5 Circuit

Circuit/System Description

The engine control module (ECM) has 5 internal 5 V reference circuits. Each internal reference circuit provides external 5 V reference circuits for more than one sensor. A short to ground or short to voltage on one external 5 V reference circuit can affect all the components connected to the same internal 5 V reference circuit.

Conditions for Running the DTC

The DTCs run continuously when the ignition voltage is greater than 6.4 V.

Conditions for Setting the DTC

The ECM detects a short to ground or voltage on any of the 5 V reference circuits for greater than 0.5 s.

Action Taken When the DTC Sets

DTCs P0641, P0651, P0697, P06A3, and P06D2 are Type A DTCs.

Conditions for Clearing the DTC

DTCs P0641, P0651, P0697, P06A3, and P06D2 are Type A DTCs.

Diagnostic Aids

The 5 V reference 1 circuit provides 5 V circuits to the sensors listed below:

- Air conditioning (A/C) refrigerant pressure sensor
- Exhaust camshaft position sensor
- Intake camshaft position sensor
- Fuel tank pressure sensor

The 5 V reference 2 circuit provides 5 V circuits to the sensors listed below:

- Evaporative emission system leak detection pump assembly
- Crankshaft position sensor

The 5 V reference 3 circuit provides 5 V circuits to the sensors listed below:

- Manifold Absolute Pressure Sensor
- Accelerator Pedal Position Sensor 2

The 5 V reference 4 circuit provides 5 V circuits to the sensors listed below:

- Accelerator pedal position sensor 1
- Throttle position sensor 1 and 2

Disconnecting one component at a time from the affected 5 V reference circuit while observing the scan tool 5 V Reference Circuit Status parameter may help locate the fault. The scan tool parameter will change from Malfunction to OK when the source of the fault is disconnected. If all 5 V reference components have been disconnected and a fault is still indicated, the fault may exist in the wiring harness.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.

2. Verify all scan tool 5 V Reference Circuit Status parameters do not display Malfunction.
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.
 - **If Malfunction is not displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

NOTE: Additional DTCs will set when disconnecting the components.

1. Vehicle OFF, disconnect the harness connector at all appropriate sensors for the applicable DTC. Refer to Diagnostic Aids.
2. Vehicle in Service Mode.
3. Test for 4.8 - 5.2 V between one of the 5 V reference circuits and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit for each applicable component and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module.
 2. Test for less than 1 V between the 5 V reference circuit for each applicable component and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**

NOTE: A short to voltage or ground on the signal circuit of certain components may cause this DTC to set.

4. Vehicle in Service Mode.
5. Verify the appropriate scan tool 5 V Reference 1, 2, 3, or 4 Circuit Status parameter displays OK while connecting each component associated with the 5 V reference circuit one at a time.
 - **If OK is not displayed when a component is connected**

Test the signal circuit of that component for a short to ground or voltage. If the circuit tests normal, replace the component.

- **If OK is displayed after all components have been connected**

6. All OK.

DTC P0650, P263A, OR P263B: MALFUNCTION INDICATOR LAMP (MIL) CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P0650

Malfunction Indicator Lamp (MIL) Control Circuit

DTC P263A

Malfunction Indicator Lamp (MIL) Control Circuit Low Voltage

DTC P263B

Malfunction Indicator Lamp (MIL) Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0650	P0650	-	-
Control	P0650, P263A *	P0650, P263A	P263B	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
* The MIL remains ON				

Circuit/System Description

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has occurred and the powertrain control system requires service. Ignition voltage is supplied directly to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit when the emission system fault occurs. Under normal operating conditions, the MIL should be ON only when the vehicle is ON and the engine is OFF.

Conditions for Running the DTC

- The ignition is ON or the engine is running.
- The ignition voltage is greater than 11 V.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

DTC P0650 or DTC P263A

The ECM detects low voltage during the MIL control circuit driver OFF state. This indicates either a shorted to ground or an open MIL control circuit.

DTC P263B

The ECM detects high voltage on the MIL control circuit during the driver ON state. This indicates a shorted to voltage MIL control circuit.

Action Taken When the DTC Sets

DTC P0650, P263A, and P263B are type B DTCs, with no MIL request

Conditions for Clearing the DTC

DTC P0650, P263A, and P263B are type B DTCs, with no MIL request.

Diagnostic Aids

If the ECM detects low voltage on the MIL control circuit during the control circuit driver OFF state, DTCs P0650 and DTC P263A may set simultaneously.

Circuit/System Verification

1. Engine Running.
2. Verify that the malfunction indicator lamp turns ON and OFF when commanding the Malfunction Indicator Lamp (MIL) On and Off with a scan tool.
 - **If the malfunction indicator lamp does not turn ON and OFF**

Refer to Circuit/System Testing.
 - **If the malfunction indicator lamp turns ON and OFF**
3. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions you observed from the Freeze Frame/Failure Records data.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
4. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the P16 Instrument Cluster, vehicle in Service Mode.
2. Verify a test lamp illuminates between the control circuit terminal 16 and B+ when commanding the Malfunction Indicator Lamp (MIL) On and Off with a scan tool.
 - **If the test lamp is always ON**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance, replace the K20 Engine Control Module.
- **If the test lamp is always OFF**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
 3. Vehicle OFF.
 4. Test for less than 2 Ω between the control circuit end to end.
 - If 2 Ω or greater, repair the open high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If the test lamp turns ON and OFF**
 3. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Instrument Cluster Replacement](#)
- Refer to [Control Module References](#) for engine control module replacement, programming, and setup.

DTC P0685-P0690, P1682, P16A7, P16AF, OR P16B3: ENGINE CONTROLS IGNITION RELAY/IGNITION 1 SWITCH CIRCUIT 2

Diagnostic Instructions

Circuit/System Description

Circuit	Description
B+ - Relay Coil	Supplied directly from the battery.
B+ - Relay Switch	Supplied directly from the battery.
Control - Component	The output circuit is switched to 12 V to activate the component.
Control - Relay Coil	The output circuit is switched to ground to activate the component.

Components

Component	Description
-----------	-------------

Component	Description
KR75 Engine Controls Ignition Relay	The powertrain relay is controlled by the Engine Control Module (ECM) depending upon input from the ignition switch. Battery positive voltage is supplied to the relay coil and switch. When the ignition switch is turned to the ON position, the ECM will provide ground on the control circuit of the powertrain relay using a low side driver. This will allow voltage through the relay switch contacts to the components. The ECM monitors the voltage level on the control circuit of the powertrain relay.
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.

4 ignition voltage circuits supply the ECM. The 4 circuits are supplied by 2 relay(s):

- KR73 Ignition Main Relay
- KR75 Engine Controls Ignition Relay

The ECM monitors and compares the voltages supplied by the relay(s).

Conditions for Running the DTC

P0685, P0686, P0687

Ignition Voltage = Greater than 11 V

DTCs run continuously when the above condition is met.

P0689, P16AF

- Ignition Voltage = Greater than 11 V
- Engine Controls Ignition Relay Command = On

DTC runs continuously when the above conditions are met.

P0690, P16B3

- DTC P0685 = Not set
- Engine Controls Ignition Relay Command = Off - For greater than 2 s

DTC runs continuously when the above conditions are met.

P1682, P16A7

- Engine Controls Ignition Relay Command = On
- Ignition Voltage = Greater than 5.5 V

DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P0685, P0686, P0687

The commanded state of the driver and the actual state of the control circuit do not match for greater than 2 s.

P0689

Engine Controls Ignition Relay Feedback Circuit = Less than 5 V - For greater than 5 s

P0690

Engine Controls Ignition Relay Feedback Circuit = Greater than 4 V - For greater than 5 s

P1682, P16A7

The following parameters are not within 3 V of each other:

- Ignition 1 Signal
- Engine Controls Ignition Relay Feedback Signal
- Engine Controls Ignition Relay Feedback 2 Signal

P16AF

Engine Controls Ignition Relay Feedback 2 Signal = Less than 5 V - For greater than 5 s

P16B3

Engine Controls Ignition Relay Feedback 2 Signal = Greater than 4 V - For greater than 5 s

Actions Taken When the DTC Sets

- DTCs P0685, P0686, P0687, P0689, P0690, P16AF, P16B3 are Type C DTCs.
- DTCs P1682, P16A7 are Type A DTCs.

Conditions for Clearing the DTC

- DTCs P0685, P0686, P0687, P0689, P0690, P16AF, P16B3 are Type C DTCs.
- DTCs P1682, P16A7 are Type A DTCs.

Diagnostic Aids

If the condition is intermittent, wiggle the related wiring harnesses and connectors, with the ignition/vehicle on or engine running, while monitoring the scan tool circuit status parameters for the component. The parameters will display if there is a condition with the circuit or a connection.

1. Ignition - On/Vehicle - In Service Mode
2. Verify no other DTCs are set.
 - **If other DTCs are set**

Refer to: [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If no other DTCs are set**
3. Ignition/Vehicle - Cycle On and Off

Verify the component produces a clicking sound: KR75 Engine Controls Ignition Relay

- **If the component does not produce a sound**

Refer to: Circuit/System Testing

- **If the component produces a sound**
4. Verify the following parameters are within 3 V of each other:
 - Ignition 1 Signal
 - Engine Controls Ignition Relay Feedback Signal
 - **If not within 3 V of each other**

Refer to: Circuit/System Testing

- **If within 3 V of each other**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle Off.
2. Remove the component: KR75 Engine Controls Ignition Relay
3. Verify a test lamp turns On between the test points:

- B+ circuit terminal 30 & Ground
- B+ circuit terminal 85 & Ground
- **If the test lamp does not turn On**

Replace the component: X50A Fuse Block - Underhood

- **If the test lamp turns On**

4. Ignition - On/Vehicle - In Service Mode
5. Connect a test lamp between the test points: Control circuit terminal 86 & B+ circuit
6. Perform the scan tool control function: KR75 Engine Controls Ignition Relay - On and Off

Verify the test lamp turns On and Off.

- **If the test lamp is always Off**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
3. Ignition - On/Vehicle - In Service Mode
4. Test for less than 1 V between the test points: Control circuit terminal 86 @ Relay Socket & Terminal 67 @ Control module harness

- If 1 V or greater - Repair the short to voltage on the circuit.
- If less than 1 V

5. Ignition/Vehicle - Off

6. Test for less than 2 ohms between the test points: Control circuit terminal 86 @ Relay Socket & Terminal 67 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K20 Engine Control Module

- **If the test lamp is always On**

1. Ignition/Vehicle - Off & Remove - Test lamp

2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
3. Test for infinite resistance between the test points: Control circuit terminal 86 @ Relay Socket & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K20 Engine Control Module
 - **If the test lamp turns On and Off**
7. Verify the fuse is not open:
 - F4UA Fuse
 - F17UA Fuse
 - **If the fuse is open**
 1. Vehicle Off.
 2. Disconnect the electrical connector: X1 @ K20 Engine Control Module
 3. Test for infinite resistance between the test points: Output terminal @ Fuse & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K20 Engine Control Module
 - **If the fuse is not open**
8. Ignition - On/Vehicle - In Service Mode
9. Verify a test lamp does not turn On between the test points: KR75 Engine Controls Ignition Relay Terminal 87 & Ground

DTC P06E4: CONTROL MODULE WAKE-UP CIRCUIT PERFORMANCE (ECM)

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P06E4

Control Module Wake-Up Circuit Performance

Circuit/System Description

This DTC can set in either the engine control module (ECM) or the Hybrid/EV Powertrain Control Module 2. These modules share the same circuit for this DTC however the criteria and reasons for setting are different. Whenever the propulsion system goes active, the diagnostic reads its internal timer and evaluates the results from the wake-up events that could have occurred.

For each wake-up event the status can be:

- Pass - the wake-up event occurred within a window 14 V Power Module
- Indeterminate - the ECM was already awake at the time the wake-up event could have occurred
- Fail - the wake-up event occurred outside a window or did not occur at all

If any of the wake-up events indicate a failure then the DTC fails.

Conditions for Running the DTC

- DTC's P0502, P0503, P0722, P0723, P262B, U182D, U0073, U0074 or P2537 is not set.
- Drive distance of greater than 0.1 mi.

Conditions for Setting the DTC

Whenever the propulsion system goes active, the ECM diagnostic reads its internal timer and evaluates the results from the wake-up events that could have occurred. The DTC fails if any of the wake-up events did not occur within a specified window:

- The 5.0 h wake-up event did not occur from 4.3 to 5.8 h.
- The 7.0 h wake-up event did not occur from 6.0 to 8.1 h.
- The 9.5 h wake-up event did not occur from 8.2 to 11.0 h.

Action Taken When the DTC Sets

DTC P06E4 is a type B DTC.

Conditions for Clearing the DTC

DTC P06E4 is a type B DTC.

Reference Information

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P06E4, P24EF, P24F0, or P24F1 is set in the K114B Hybrid/EV Powertrain Control Module 2.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If none of the DTCs are set**

Replace the K20 Engine Control Module and perform repair verification.

Repair Verification

1. Drive the vehicle for greater than 0.1 mi.
2. Park the vehicle and let it set for a minimum of 6 h. This allows the ECM to request a K114B Hybrid/EV Powertrain Control Module 2 wake-up to occur.
3. Vehicle in Service Mode.
4. Verify DTC P06E4 did not set.

- **If DTC is set**

Replace the K20 Engine Control Module and repeat steps 1 - 4.

- **If no DTC's are set**

5. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for control module replacement, programming and setup.

DTC P1101: INTAKE AIR FLOW SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)

- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P1101

Intake Air Flow System Performance

Circuit/System Description

This system consists of the following components:

Component	Description
B75C Multifunction Intake Air Sensor	The assembly has several functions: • The mass air flow sensor is a hot film type sensor that measures the mass of air (not the volume) entering the engine. The signal varies with engine load and is displayed by the scan tool in Hertz (Hz) and grams per second (g/s). • The intake air humidity sensor uses the same signal circuit as the intake air temperature sensor 2. The intake air humidity sensor modulates the pulse width of the signal. The intake air temperature sensor 2 modulates the frequency of the signal. That means the signal is both, PWM and FM modulated. • The barometric pressure sensor generates an analog voltage that is proportional to the ambient air pressure. • The intake air temperature sensor 1 varies its resistance depending on the temperature. • Low temperature produces a high resistance: 126.8 kohms @ -60Â°C (-76Â°F) • High temperature produces a low resistance: 62 ohms @ 150Â°C (302Â°F)
B74 Manifold Absolute Pressure Sensor	The sensor is a 3-wire capacitive pressure transducer. Electronics in the sensor convert pressure into an analog voltage signal.
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.
Q38 Throttle Body	The throttle body contains a contactless inductive position sensor. A fixed transmitter coil excites a movable rotor, which in turn induces a current in a fixed receiver coil. The current varies with the angle of the rotor. Electronics inside the sensor convert the current into digital data which is transmitted via a

Component	Description
	serial data circuit to the ECM.

The ECM compares the measured mass air flow with the calculated air flow based on throttle position and the calculated air flow based on manifold absolute pressure.

Conditions for Running the DTC

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0116, P0117, P0118, P0128, P0335, P0336 = Not set
- Engine Speed = 0 to 5,400 RPM
- Engine Coolant Temperature = -7 to +129Â°C (+19 to +264Â°F)
- Intake Air Temperature Sensor = -20 to +125Â°C (-4 to +257Â°F)

DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The difference between the air flow measured by the mass air flow sensor and a calculated value based on the throttle position exceeds the allowed range.

Actions Taken When the DTC Sets

DTC P1101 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1101 is a Type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0641, P0651, P0697, P06A3 is not set.
 - **If any of the DTCs are set**

Refer to: **DTC P0641, P0651, P0697, P06A3, or P06D2**
 - **If none of the DTCs are set**
3. Verify the scan tool parameter: Throttle Body Idle Air Flow Compensation = Less than 90%
 - **If 90% or greater**

Refer to: **Throttle Body Inspection and Cleaning**
 - **If less than 90%**
4. Perform a component sweep test: Throttle Sweep

Verify the scan tool parameter: Throttle Position Sensors 1 and 2 = Agree
 - **If not the specified state**

Refer to: **DTC P0121-P0123, P0222, P0223, P16A0-P16A2, or P2135**
 - **If the specified state**
5. Determine the current vehicle testing altitude.
6. Verify the scan tool parameter: MAP Sensor = **Altitude Versus Barometric Pressure**
 - **If not in the specified range**

Refer to: **DTC P0106**
 - **If in the specified range**
7. Verify the following conditions do not exist:
 - Vacuum leak at the component:
 - Intake Manifold
 - B74 Manifold Absolute Pressure Sensor
 - Q38 Throttle Body
 - An object is blocking the component:
 - Q38 Throttle Body
 - Restrictions in the intake system.
 - Loose clamps, cracks, or other damages to the intake system.
 - Water intrusion at the mass air flow sensor.
 - Contamination of the measuring element of the mass air flow sensor.

- Missing, restricted or leaking exhaust components. - Refer to: [Symptoms - Engine Exhaust](#)
- An engine mechanical condition. - Refer to: [Symptoms - Engine Mechanical](#)
- **If a condition is found**

Repair or replace component as appropriate.

- **If no condition is found**

8. Engine idling.

9. Verify the scan tool parameter: MAP Sensor = 26 and 52 kPa (3.8 and 7.5 PSI) and changes - The value should change with accelerator pedal input.

- **If not between 26 and 52 kPa (3.8 and 7.5 PSI) or does not change**

Refer to: [DTC P0106](#)

- **If between 26 and 52 kPa (3.8 and 7.5 PSI) and changes**

10. Engine = At normal operating temperature.

11. Engine Speed = 1,375 to 1,425 RPM

12. Verify the scan tool parameter: MAF Sensor = 1,800 and 2,400 Hz

- **If not between 1,800 and 2,400 Hz**

Refer to: [DTC P0101](#)

- **If between 1,800 and 2,400 Hz**

13. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

14. Verify that no DTCs are set.

- **If any DTC is set**

Refer to: [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If no DTC is set**

15. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC P111E: ENGINE COOLANT TEMPERATURE SENSOR NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P111E

Engine Coolant Temperature Sensor Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Signal	P0117	P0118	P0118	P0118	P0128, P111E
Low Reference	-	P0118	P0118	-	P0128

Typical Scan Tool Data

ECT Sensor Temperature

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running Parameter Normal Range: -39 to +120Â°C (-38 to +248Â°F)			
ECT Sensor	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)

Circuit/System Description

The engine coolant temperature (ECT) sensor is a variable resistor that measures the temperature of the engine coolant. The engine control module (ECM) supplies 5V to the ECT sensor signal circuit and a ground for the low reference circuit.

The purpose of this diagnostic is to determine if the input from the ECT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the engine is OFF. If the required engine OFF time is met at start-up, the ECM will compare the temperature difference between the actual measured ECT and a calibrated ECT model. The information for this model is derived from the previous drive cycle and includes the accumulated mass air flow (MAF), the engine run time, the ambient air temperature and the ECT at the end of the drive cycle.

If the ECM detects that the temperature difference between the measured and modeled ECT is not within an acceptable operating range of each other, then the ECM will continue to run this diagnostic to determine if a block heater was active during the engine OFF time.

Conditions for Running the DTC

- DTCs P0111, P0112, P0113, P0114, P0117, P0118, P0128, P0502, P0503, P0601, P1621, or P2610 are not set.
- The vehicle has had a minimum ignition OFF time of 8 hours.
- The engine is running.
- The start-up modeled ECT is colder than 50Â°C (+122Â°F).
- The previous accumulated MAF is greater than 6,000 grams.
- The previous engine run time is greater than 600 seconds.

OR

- The vehicle has had a minimum ignition OFF time of 8 hours.
- The engine is running.
- The previous ECT at engine shutdown is warmer than 75°C (+167°F).
- The previous accumulated MAF is greater than 6,000 grams.
- The previous engine run time is greater than 600 seconds.
- This DTC runs once per ignition cycle within the enabling conditions.

Conditions for Setting the DTC

P111E

The ECM detects a temperature difference at initial power-up that indicates that the actual measured ECT is 10°C (18°F) greater than the modeled ECT, and an active block heater has not been detected.

Action Taken When the DTC Sets

DTC P111E is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P111E is a Type B DTC.

Diagnostic Aids

- Engine coolant that is leaking through the sensor will create a high resistance short to ground. This condition results in less voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a warmer ECT.
- The ECM memory which includes the ignition OFF timer is maintained by battery power. If the ECM or the battery are disconnected for less than 15 seconds the proper operation of the ECM memory and the timer can be disrupted. Always disconnect these components for greater than 30 seconds.
- A failed start due to low battery voltage may cause P111E to set when ambient temperature is below -7°C (19°F) and a block heater has been use. If this occurs clear the DTC and operate the vehicle within the Conditions for Running the DTC, if P111E sets refer to Circuit/System Verification.

[Circuit/System Verification](#)

1. Verify the cooling system is filled to the correct coolant level. Refer to [Cooling System Leak Testing](#) , and [Cooling System Draining and Filling](#)

- **If the coolant level is not filled to the correct level**

Repair as necessary.

- **If the coolant level is correct**

2. Verify that DTC P00B3, P00B4, P0111, P0112, P0113, P0114, P0117, P0118, P0128, P0601, P112F, P1621, or P2610 is not set.

- **If DTC P00B3, P00B4, P0111, P0112, P0113, P0114, P0117, P0118, P0128, P0601, P112F, P1621, or P2610 is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If DTC P00B3, P00B4, P0111, P0112, P0113, P0114, P0117, P0118, P0128, P0601, P112F, P1621, or P2610 is not set**

3. Vehicle OFF for a minimum of 8 hours.

4. Vehicle in Service Mode

5. Verify with a scan tool that IAT Sensor 1, Radiator Coolant Temperature Sensor, Ambient Temperature Sensor and the ECT Sensor are within 15Â°C (59Â°F) of each other.

- **If the Radiator Coolant Temperature Sensor parameter is not within 15Â°C (59Â°F) of the ECT Sensor and IAT Sensor 1 or ambient temperature.**

Perform the diagnostic for DTC P00B3 or P00B4, Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If the IAT Sensor 1 parameter is not within 15Â°C (59Â°F) of the ECT Sensor and Radiator Coolant Temperature Sensor or ambient temperature.**

Perform the diagnostic for DTC P0112, P0113, or P0114, Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If the ECT Sensor parameter is not within 15Â°C (59Â°F) of the IAT Sensor 1 and Radiator Coolant Temperature Sensor or ambient temperature.**

Refer to Circuit/System Testing.

- **If all the parameters are within 15Â°C (59Â°F) of each other and ambient temperature.**

6. Vehicle OFF.

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

8. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

9. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the B34 Engine Coolant Temperature Sensor harness connector at the sensor. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Verify the scan tool ECT Sensor parameter is colder than -39Â°C (-38Â°F).

- **If warmer than -39Â°C (-38Â°F)**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance.

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, replace the K20 Engine Control Module

- **If colder than -39Â°C (-38Â°F)**

5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.

6. Verify the scan tool ECT sensor parameter is warmer than 149Â°C (300Â°F).

- **If warmer than 149Â°C (300Â°F)**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V

7. Test or replace the B34 Engine Coolant Temperature Sensor.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B34 Engine Coolant Temperature Sensor.
2. Test the ECT sensor by varying the sensor temperature while measuring the sensor resistance. Compare the readings with the [Temperature Versus Resistance \(Engine Coolant Temperature Sensor\)](#) table. The resistance values should be in range of the table values.

- **If not within the specified range**

Replace the B34 Engine Coolant Temperature Sensor.

- **If within the specified range**

3. Test for infinite resistance between each terminal and the sensor housing.

- **If less than infinite resistance**

Replace the B34 Engine Coolant Temperature Sensor.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Engine Coolant Temperature Sensor Replacement - Water Outlet](#)
- Refer to [Control Module References](#) for K20 engine control module (ECM) replacement, programming, and setup.

DTC P1255: FUEL PUMP CONTROL MODULE DRIVER HIGH TEMPERATURE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1255

Fuel Pump Control Module Driver High Temperature

Circuit/System Description

The engine control module (ECM) supplies voltage to the fuel pump driver control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump driver control module remains active

for 2 s, unless the engine is in crank or run. While this voltage is being received, the fuel pump driver control module supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel pressure.

Conditions for Running the DTC

- The ignition voltage is between 9 - 32 V.
- The engine is cranking or running.
- The fuel pump enable circuit is commanded ON.
- The DTC runs continuously when the conditions above are met.

Conditions for Setting the DTC

The fuel pump driver control module detects a driver temperature greater than or equal to 320°F (160°C) for less than 0.2 s.

Action Taken When the DTC Sets

DTC P1255 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1255 is a Type B DTC.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0231, P0232, or P023F is not set.
 - **If any of the DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
 - **If none of the DTCs are set**
3. Verify that the area where the K111 Fuel Pump Driver Control Module is located is free of debris, clutter, or any insulating material that would cause the fuel pump driver control module to overheat.
 - **If any debris, clutter, or other material is found**
 1. Clear the area where the K111 Fuel Pump Driver Control Module is located.
 2. Clear the DTC and test drive the vehicle.
 3. Verify the DTC does not set.
 - If the DTC sets, replace the K111 Fuel Pump Driver Control Module.
 - If the DTC is not set
 4. All OK.
 - **If no debris, clutter, or other material is found**
4. Clear the DTC and test drive the vehicle.
5. Verify the DTC does not set.
 - **If the DTC sets**

Replace the K111 Fuel Pump Driver Control Module.
 - **If the DTC does not set.**
6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Fuel Pump Power Control Module Replacement**

DTC P127C, P128A-P128D, P128F, P16E4, OR P16E5: FUEL RAIL PRESSURE SENSOR 2-1/FUEL RAIL PRESSURE-TEMPERATURE SENSOR/SENSOR COMMUNICATION CIRCUIT 3 VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0452, P06D2, P16E5	P16E4	P06D2, P128A, P128B	P0191
Signal	P16E4	P128C, P128D, P16E5	P16E5	P0191
Low Reference	-	P128C, P128D, P16E5	-	P0191

Typical Scan Tool Data

Fuel Rail Pressure Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: The engine is operating with the throttle closed. All accessories OFF. Parameter Normal Range: 2.9-3.2 MPa			
5 V Reference	655.4 MPa	655.4 MPa	655.4 MPa
Signal	655.4 MPa	655.4 MPa	655.4 MPa
Low Reference	-	655.4 MPa	-

Circuit/System Description

The fuel pressure/temperature sensor transmits fuel pressure and temperature information by serial data using the Society of Automotive Engineers (SAE) J2716 Single Edge Nibble Transmission (SENT) protocol. The fuel pressure/temperature sensor internal microprocessor allows 4 separate sensor outputs from one 3 wire sensor. The engine control module (ECM) supplies the fuel pressure/temperature sensor with a 5 V reference circuit, a low reference circuit, and an asynchronous signal/serial data circuit. The asynchronous signal means communication is only going from the fuel pressure/temperature sensor to the ECM. The ECM decodes the serial data signal into separate voltages.

Conditions for Running the DTC

P127C, P16E4 or P16E5

- Ignition is ON.
- No DTC clear code.
- The DTCs run continuously when the above conditions are met.

P128A or P128B

- DTC P128F, P16E4 or P16E5 is not set.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

P128C, P128D, or P128F

- DTC P16E4 or P16E5 is not set.
- Ignition is ON.
- The DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

P127C

The engine control module detects the fuel pressure sensor 2 SENT digital read value is less than or equal to 76 for greater than 30 s with the engine running or greater than 10 s with the engine cranking.

P128A

The engine control module detects the fuel pressure sensor 1 SENT digital read value is greater than or equal to 4,089 for greater than 3 s.

P128B

The engine control module detects the fuel pressure sensor 2 SENT digital read value is greater than or equal to 4,089 for greater than 3 s.

P128C

The engine control module detects communication errors on the fuel pressure sensor temperature 1 SENT signal circuit for greater than 1 s.

P128D

The engine control module detects communication errors on the fuel pressure sensor temperature 2 SENT signal circuit for greater than 1 s.

P128F

The engine control module detects fuel pressure sensor SENT signal discrepancies for greater than 3 s.

P16E4

The engine control module detects the fuel pressure sensor SENT signal shorted low for greater than 3 s.

P16E5

The engine control module detects the fuel pressure sensor SENT signal shorted high for greater than 3 s.

Action Taken When the DTC Sets

- DTCs P127C, P128A, P128B, P128F, P16E4, and P16E5 are Type A DTCs.
- DTCs P128C and P128D are Type B DTCs.
- A message center or an indicator displays Propulsion Power is Reduced and Service Stabilitrak.

Conditions for Clearing the DTC

- DTCs P127C, P128A, P128B, P128F, P16E4, and P16E5 are Type A DTCs.
- DTCs P128C and P128D are Type B DTCs.

Diagnostic Aids

- A high resistance condition on the fuel pressure/temperature sensor circuits could cause a DTC to set.
- Inspect for a contaminated fuel system.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify that DTC P0641, P0651, P0697, or P06A3 is not set.
 - **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If none of the DTCs are set**
3. Verify that DTC P0182, P0183, P0187, P0188, P111F, P126E, P126F, P127C, P128A, P128B, P128C, P128D, P128F, P16E4, or P16E5 are not set.

- **If DTC P128A, P128B, P128C, P128D, or P128F are the only DTCs set**

Replace the B310 Fuel Pressure/Temperature Sensor.

- **If DTC P0183, P0184, P0187, P0188, P111F, P126E, P126F, P127C, P16E4, or P16E5 is set with any of the DTCs**

Refer to Circuit/System Testing.

- **If none of the DTCs are set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 5. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: **Disconnecting the fuel pressure/temperature sensor harness connector causes additional DTCs to set.**

1. Ignition/Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at B310 Fuel Pressure/Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.

- **If 5 Ω or greater**

1. Ignition/Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 5 Ω**

3. Ignition/Vehicle ON.

4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 2 and ground.

- **If less than 4.8 V**

1. Ignition/Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.2 V**

1. Ignition/Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, ignition/vehicle ON.

2. Test for less than 1 V between the 5 V reference circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 4.8 - 5.2 V**

5. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.

- **If less than 4.8 V**

1. Ignition/Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Ignition/Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, ignition/vehicle ON.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
6. Replace the B310 Fuel Pressure/Temperature Sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Injection Fuel Rail Fuel Pressure Sensor Replacement](#) for B310 Fuel Pressure/Temperature Sensor
- Refer to [Control Module References](#) for K20 Engine Control Module replacement, programming, and setup

DTC P129E OR P12A8: FUEL PUMP DRIVER CONTROL MODULE SIGNAL MESSAGE COUNTER INCORRECT/FUEL PUMP CONTROL SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for a overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P129E

Fuel Pump Driver Control Module Signal Message Counter Incorrect

DTC P12A8

Fuel Pump Control Signal Message Counter Incorrect

Circuit/System Description

The fuel pump power control module is in constant communication with the engine control module (ECM) regarding the operating state of the fuel pump power control system. Serial data messages are sent in a continuously repeating series of rolling counts with associated password protect samples. Each count/sample is assigned a value. When the ECM determines that too many of the counts/samples contain an error value, the ECM sets DTC P129E or P12A8.

Conditions for Running the DTC

- The ignition voltage is greater than 7 V.
- The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects an error value for over 1 s.

Action Taken When the DTC Sets

DTC P129E and P12A8 are Type A DTCs.

Conditions for Clearing the DTC

DTC P129E and P12A8 are Type A DTCs.

Diagnostic Aids

An intermittent fault in the CAN circuits will cause the ECM to set DTC P129E or P12A8.

Circuit/System Verification

NOTE:

- DTC P129E and P12A8 are informational DTCs.
- Diagnose all other engine control module DTCs prior to DTC P129E or P12A8.

1. Verify that no other DTCs are set except for DTC P129E or P12A8.

- If any other DTCs are set

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- If only DTC P129E or P12A8 is set

2. Replace the K111 Fuel Pump Power Control Module.

3. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- If DTC sets

Replace the K20 Engine Control Module.

- If DTC does not set

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Control Module References](#) for K111 Fuel Pump Power Control Module and K20 Engine Control Module replacement, programming, and setup

DTC P129B OR P129C: FUEL PUMP DRIVER CONTROL MODULE SYSTEM VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P129B

Fuel Pump Driver Control Module System Voltage Low Voltage

DTC P129C

Fuel Pump Driver Control Module System Voltage High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage

Circuit/System Description

The fuel pump driver control module monitors the battery positive voltage circuit to verify the voltage is between the normal operating range. The DTC can set for a circuit or system voltage out of range.

Conditions for Running the DTC

P129B

- The engine is running.
- The ignition voltage is between 9 - 32 V.
- The fuel pump enable circuit is commanded ON.
- The DTC runs continuously when the above conditions are met.

P129C

- The engine is not running.
- The ignition voltage is between 9 - 32 V.
- The fuel pump enable circuit is commanded ON.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P129B

The fuel pump driver control module detects the battery positive voltage is less than 7 V for 1 s.

P129C

The fuel pump driver control module detects the battery positive voltage is greater than 18 V for 1 s.

Action Taken When the DTC Sets

DTC P129B and P129C are Type C DTCs.

Conditions for Clearing the DTC

DTC P129B and P129C are Type C DTCs.

Circuit/System Verification

1. Vehicle OFF.
2. Test for 12.4 - 12.8 V at the battery terminals and record the reading. The battery voltage should stabilize after a few minutes of turning the Vehicle OFF.
 - **If not between 12.4 V - 12.8 V**

Refer to Battery Inspection/Test .
 - **If between 12.4 V - 12.8 V**
3. Engine Running, accessories OFF.
4. Test for 13.4 - 15 V at the battery terminals and record the reading.
 - **If not between 13.4 - 15 V**

Refer to Charging System Test .
 - **If between 13.4 - 15 V**
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
7. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 9 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
- **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K111 Fuel Pump Driver Control Module.
- **If the test lamp illuminates**
 4. Replace the K111 Fuel Pump Driver Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for Fuel Pump Power Control Module replacement, programming, and setup

DTC P129D: FUEL PUMP DRIVER CONTROL MODULE IGNITION ON/START SWITCH CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P129D

Fuel Pump Driver Control Module Ignition On/Start Switch Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P129D	P129D	-	-

Circuit/System Description

The fuel pump driver control module monitors the ignition voltage circuit in order to determine if the voltage is within the normal operating range.

Conditions for Running the DTC

The DTC runs continuously when the modules are awake.

Conditions for Setting the DTC

The fuel pump driver control module Power Mode does not agree with the engine control module (ECM) Power Mode for 1 s.

Action Taken When the DTC Sets

DTC P129D is a Type B DTC.

Conditions for Clearing the DTC

DTC P129D is a Type B DTC.

Refer to Circuit/System Testing.

- **If the DTC does not set**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify DTC P129D is not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed first or misdiagnosis may result.**

1. Vehicle OFF, all vehicle systems OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Vehicle in Service Mode.
3. Verify a test lamp illuminates between the ignition circuit terminal 6 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp, and disconnect all components on the circuit.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Replace the fuse, Vehicle in Service Mode.
4. Verify the fuse is good after connecting each of the components one at a time.
 - If the fuse opens, replace the component that opens the fuse when connected.
 - If the fuse is good, all OK.

- **If the test lamp illuminates**

4. Replace the K111 Fuel Pump Driver Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for Fuel Pump Power Control Module replacement, programming, and setup

DTC P12A6: FUEL PUMP DRIVER CONTROL MODULE ENABLE CIRCUIT PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P12A6

Fuel Pump Driver Control Module Enable Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Pump Enable	P0171, P0506, P0628, P12A6	P0171, P0506, P12A6	-	P12A6

Circuit/System Description

The engine control module (ECM) provides ignition voltage to the fuel pump driver control module whenever the engine is cranking or running. The control module enables the fuel pump driver control module as long as the engine is cranking or running, and ignition system reference pulses are received. While this enable voltage is being received, the fuel pump driver control module supplies a varying voltage to the in-tank fuel pump module in order to maintain the desired fuel line pressure.

Conditions for Running the DTC

- The ignition voltage is greater than or equal to 9 V.
- The DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM state of the fuel pump enable circuit does not match the state of the fuel pump enable circuit sensed by the fuel pump driver control module for 1 s.

Action Taken When the DTC Sets

DTC P12A6 is a Type A DTC.

Conditions for Clearing the DTC

DTC P12A6 is a Type A DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P12A6 is not set.
 - **If the DTC is set**

Refer to Circuit/System Testing.
 - **If the DTC is not set**
3. Verify the parameters listed below do not display Malfunction when commanding the Fuel Pump Enable On and Off with a scan tool.
 - Fuel Pump Enable Circuit Low Voltage Test Status
 - Fuel Pump Enable Circuit Open Test Status
 - Fuel Pump Enable Circuit High Voltage Test Status
 - **If Malfunction is displayed**

Refer to Circuit/System Testing.
 - **If Malfunction is not displayed**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF, all vehicle systems OFF, disconnect the harness connector at the K111 Fuel Pump Driver Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Vehicle in Service Mode for greater than 10 s.
3. Verify that a test lamp does not illuminate between the control circuit terminal 2 and ground.

- **If the test lamp illuminates**

1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

4. Remove the test lamp.
5. Verify the scan tool Fuel Pump Enable Circuit Low Voltage Test Status parameter is OK when commanding the Fuel Pump Enable On with a scan tool.

- **If OK is not displayed**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If OK is displayed**

6. Install a 3 A fused jumper wire between the control circuit terminal 2 and ground.
7. Verify the scan tool Fuel Pump Enable Circuit Low Voltage Test Status parameter is Malfunction when commanding the Fuel Pump Enable On with a scan tool.

- **If Malfunction is not displayed**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If Malfunction is displayed**

8. Replace the K111 Fuel Pump Driver Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for ECM and Fuel Pump Power Control Module replacement, setup, and

programming

DTC P135A: IGNITION COIL SUPPLY VOLTAGE CIRCUIT BANK 1

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P135A

Ignition Coil Supply Voltage Circuit Bank 1

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0201, P0202, P0203, P0204, P0300, P0351, P0352, P0353, P0354, P135A	P0201, P0202, P0203, P0204, P0300, P0351, P0352, P0353, P0354, P135A	-	-

Circuit/System Description

The ignition system uses an individual ignition coil for each cylinder. The engine control module (ECM) monitors the ignition voltage from the fuse to the individual coils.

Conditions for Running the DTC

- Delay starting at ignition On for 5 engine revolutions.
- Ignition Run/Crank relay voltage is greater than 5 V
- PT relay voltage is greater than 11 V

The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects less than 2.5 V on the ignition coil supply voltage circuit.

Action Taken When the DTC Sets

DTC P135A is a Type B DTC.

Conditions for Clearing the DTC

DTC P135A is a Type B DTC.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Ignition Coil Supply Voltage parameter displays ON.
 - **If ON is not displayed**

Refer to Circuit/System Testing.
 - **If ON is displayed**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Connect a 3 A fused jumper wire between the control circuit terminal 67 and ground, vehicle in Service Mode.
3. Verify a test lamp illuminates between the ignition circuit terminal 51 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

NOTE: The ignition circuit may supply voltage to other components. Make sure to test all circuits and components for a short to ground that share the ignition circuit.

1. Vehicle OFF, remove the test lamp, and disconnect all components on the circuit.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Replace the fuse, vehicle in Service Mode.
4. Verify the fuse is good after connecting each of the components one at a time.
 - If the fuse opens, replace the component that opens the fuse when connected.
 - If the fuse is good, all OK.

- **If the test lamp illuminates**

4. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Ignition Coil Replacement**
- Refer to **Control Module References** for engine control module replacement, programming, and setup

DTC P1400: COLD START EMISSION REDUCTION CONTROL SYSTEM

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1400

Cold Start Emission Reduction Control System

Circuit/System Description

The catalyst must be warmed to efficiently reduce the emissions. The cold start strategy is to reduce the amount

of time it takes to warm the catalyst. During a cold start, the engine spark timing is altered to allow the catalyst to warm quickly. This diagnostic monitors the following to build an exhaust energy model:

- Spark advance
- Engine airflow
- Engine coolant temperature
- Engine run time

The actual model is then compared to the expected exhaust energy model.

Conditions for Running the DTC

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0112, P0113, P0114, P0116, P0117, P0118, P0121, P0122, P0123, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0301, P0302, P0303, P0304, P0335, P0336, P0351, P0352, P0353, P0354, P0641, P0651, P0697, P06A3, P2122, P2123, P2127, P2128, P2135, and P2138 are not set.
- The engine coolant temperature (ECT) is between -12 to +56°C (10 - 132°F).
- The calculated 3-way catalyst temperature is colder than 500°C (932°F).
- The barometric (BARO) pressure is greater than 75 kPa.
- The engine control module (ECM) will exit the diagnostic if the calculated 3-way catalyst temperature is greater than 1,000°C (1832°F) when the engine run time is greater than 17 s.
- Vehicle speed is less than 1.6 km/h (1 mph).
- The accelerator pedal is not depressed.
- The ECM will exit the diagnostic if the engine run time is greater than a calibrated value.
- This DTC runs within the first 15 s of start-up. This diagnostic runs once per trip when a cold start has been determined.

Conditions for Setting the DTC

The actual exhaust energy model does not match the expected exhaust energy model.

Action Taken When the DTC Sets

DTC P1400 is a Type A DTC.

Conditions for Clearing the DTC

DTC P1400 is a Type A DTC.

Circuit/System Verification

1. Vehicle OFF, allow the engine to cool to be within the temperatures listed in the Conditions for Running the DTC.
2. Engine running.
3. Operate the vehicle within the Conditions for Running the DTC to verify the DTC does not set. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.

- **If the DTC sets**

Verify that none of the conditions listed below exists with the air intake system:

- Damage, restriction, or modification
- Dirty or deteriorating air filter element
- Crankcase ventilation system for correct operation
- Water intrusion
- Vacuum leak and other unmetered air downstream of the mass air flow (MAF) sensor
- Intake manifold leak
- **If any of the above conditions exist**

Repair as necessary.

- **If none of the conditions exist**

5. Verify that none of the conditions listed below exists with the exhaust system:

- Exhaust leak
- Damaged, restricted, or modified exhaust system - Refer to [Symptoms - Engine Exhaust](#) .
- **If any of the conditions exist**

Repair as necessary.

- **If none of the conditions exist**

If all of the above conditions test normal, inspect for an engine mechanical condition that could alter the air flow into the combustion chamber. Refer to [Symptoms - Engine Mechanical](#).

- **If the DTC does not set**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P145C OR P145D: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP STUCK OFF/ON

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P145C

Evaporative Emission (EVAP) System Leak Detection Pump Stuck Off

DTC P145D

Evaporative Emission (EVAP) System Leak Detection Pump Stuck On

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The EVAP leak detection vacuum pump stuck off test is performed by comparing an initial stabilized EVAP leak detection pump pressure sensor, absolute, reading to a second stabilized reading for a short period of time.

The EVAP leak detection vacuum pump stuck on test is performed after the switching valve transitions from vent to not venting, pump, position. If after the second EVAP leak detection pump pressure sensor reading, a difference between the two pressure readings indicates the EVAP leak detection vacuum pump is stuck on.

Conditions for Running the DTC

P145C and P145D

- DTCs P043E, P043F, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P111E, P1462, P145C, P145D, P145E, P145F, P2066, P2067, P2068, P2227, P2228, P2229, P2230, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P24BA, P24BB, P24B9, P2537, P262B, U0073, U0074, U0140 and U182D is not set.
- The propulsion system is not active.
- The EVAP purge valve is closed.
- The EVAP vent solenoid valve is closed.
- The EVAP leak detection pump switching valve is in the vent position.
- The EVAP leak detection pump vacuum pump is ON.
- The odometer greater than 16 km (10 mi).
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The engine coolant temperature is less than 40°C (104°F).
- The intake air temperature is between 4 - 45°C (39 - 113°F).
- The system voltage is greater than 10 V.
- The vehicle speed is less than 1.6 km/h (1 MPH).
- No Vehicle ON during test.
- The refueling request button is not pressed.
- A service bay test is not active.
- The device control is not active.
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 hours.

Conditions for Setting the DTC

P145C

The EVAP leak detection pump is commanded ON during the first reference orifice vacuum measurement and the stabilized EVAP leak detection pump pressure sensor vacuum reading is less than 0.1 kPa (0.01 PSI) for greater than 6 min.

Or

The EVAP leak detection pump is commanded ON during the second reference orifice vacuum measurement and the stabilized EVAP leak detection pump pressure sensor vacuum reading is less than 0.1 kPa (0.01 PSI) for greater than 30 s.

P145D

The EVAP leak detection pump is commanded OFF for the first time and the EVAP leak detection pump switching valve has transitioned from vent to not venting, pump position. The difference between an initial EVAP leak detection pump pressure sensor reading and a second EVAP leak detection pump pressure sensor reading is greater than 1 kPa (0.14 PSI) for greater than 8 s.

Or

The EVAP leak detection pump is commanded OFF for the second time and the EVAP leak detection pump pressure sensor vacuum reading is greater than 1.18 kPa (0.17 PSI) for greater than 14 s.

Action Taken When the DTC Sets

DTCs P145C and P145D are Type B DTCs.

Conditions for Clearing the DTC

DTCs P145C and P145D are Type B DTCs.

DTC P145E: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP TO VENT SOLENOID VALVE LEAK DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P145E

Evaporative Emission (EVAP) System Leak Detection Pump to Vent Solenoid Valve Leak Detected

Circuit/System Description

The EVAP system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

This DTC sets when the ECM detects a 0.51 mm (0.020 in) external leak between the EVAP leak detection pump and the EVAP vent solenoid valve or an internal leak through the EVAP vent solenoid valve.

Conditions for Running the DTC

- DTCs P043E, P043F, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P111E, P1462, P145C, P145D, P145F, P2066, P2067, P2068, P2227, P2228, P2229, P2230, P2400, P2401, P2402, P2418, P2419, P2420, P2450, P24BA, P24BB, P24B9, P2537, P262B, U0073, U0074, U0140 and U182D is not set.
- The EVAP purge valve is closed.
- The EVAP vent solenoid valve transitions to closed.
- The EVAP leak detection pump switching valve in not venting, pump position.
- The EVAP leak detection pump vacuum pump is ON.
- The odometer greater than 16 km (10 mi).
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The engine coolant temperature is less than 40Â°C (104Â°F).
- The intake air temperature is between 4 - 45Â°C (39 - 113Â°F).
- The system voltage is greater than 10 V.
- The vehicle speed is less than 4.8 km/h (3 MPH).
- No Vehicle ON during this test
- The refueling request button is not pressed.
- A service bay test is not active.
- The device control is not active.
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 h.

Conditions for Setting the DTC

The ECM detects the vacuum reading is less than the reference vacuum for greater than 30 s.

Action Taken When the DTC Sets

DTC P145E is a Type B DTC.

Conditions for Clearing the DTC

DTC P145E is a Type B DTC.

Diagnostic Aids

- The EVAP system can be filled with smoke at the fresh air side of the vacuum pump using the adapters in the **GE-41413-300** .
- Smoke seen coming out of the fresh air side of the EVAP leak detection pump assembly is not consider a failed part. This includes the electrical connection port as diagnostics will not detect a leak on the fresh air side of the system.
- To help locate intermittent leaks, use the **GE-41413-A** to introduce smoke into the EVAP system. Move all the EVAP components while observing for smoke with the **GE-41413-SPT** .
- To improve the visibility of the smoke exiting the EVAP system, observe the suspected leak area from different angles with the **GE-41413-SPT** .
- If a small leak is difficult to find, it may be necessary to remove the EVAP components and test them one at a time using the adapters in the **GE-41413-300** .
- A vent solenoid stuck in the open position will set this DTC. If the solenoid will not respond to the scan tool command, it may be electrically or mechanically inoperable.

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

WARNING: Refer to [Fuel and Evaporative Emission Pipe Warning](#) .

CAUTION: Refer to Clean, Dry, Low Pressure Gas Source Caution .

1. Verify none of the conditions listed below exist:

- Disconnected, incorrectly routed, kinked, or damaged EVAP pipes, O-rings and hoses
- A damaged EVAP vent solenoid valve - This could be a shorted solenoid or mechanically stuck.

Refer to Component Testing below.

- **If a condition exists**

Repair as necessary

- **If no conditions exist**

CAUTION: Refer to Fuel and Evaporative Emission Hose/Pipe Connection Cleaning Caution .

NOTE: Refer to the GE-41413-A operation manual for detailed instructions in Evaporative Emission Control System Diagnosis.

2. Disconnect the fresh air tube at the quick connector on the Q63 Evaporative Emission System Leak Detection Pump.

3. Using adapters in the GE-41413-300 , specifically GE-41413-323 , connect the GE-41413-A .

NOTE: Ensure that the vehicle underbody temperature is similar to the ambient temperature and allow the surrounding air to stabilize before starting the diagnostic procedure. The system flow will be less with higher temperatures.

4. Use the flow meter on the GE-41413-A calibrated to 0.51 mm (0.020 in) determine if there is a leak.

- **If a leak is detected**

Use the GE-41413-A to apply smoke to the EVAP system until the leak is located.

- **If no leak is detected**

5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to Circuit System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: Ambient and vehicle component temperature must be above 0°C (32°F) to command the switching valve or vacuum pump. This prevents erroneous

results and damage to the EVAP leak detection pump assembly.

1. Record the scan tool EVAP Leak Detection Pump pressure.
2. Command the scan tool EVAP Leak Detection Pump on for 1 min.
 1. Record the scan tool EVAP Leak Detection Pump pressure.
 2. Subtract the value in step 2.1 from the value in step 1 and record this
3. Command the scan tool EVAP Leak Detection Pump to Vent Solenoid Valve Leak Test for 30 s.
 1. Record the scan tool EVAP Leak Detection Pump pressure.
 2. Subtract the value in step 3.1 from the value recorded in step 1.
 - Example: Step 1 value 96.6 kPa (14 PSI)
 - Example: Step 2 value 93.5 kPa (13.6 PSI)
 - Example: Step 2.2 value 3.1 kPa (0.4 PSI)
 - Example: Step 3 value 90.69 kPa (13.15 PSI)
 - Example: Step 3.2 value 5.91 kPa (0.8 PSI)
4. The recommended ratio should be at least 1.50 of the value in step 2.2.
 - Example; step 1 minus step 3 = 5.91 kPa (0.85 PSI)
 - 5.91 kPa (0.85 PSI) divided by 3.1 (0.44 PSI) = 1.90 ratio.
 - **If the ratio fails the recommendation**

Inspect and repair for any of the conditions noted under Circuit/System Verification, step 1

- **If the ratio meets or exceeds the recommendation**

5. All OK

Component Testing

1. Connect **GE-41413-A** using adapter **J-41413-323** that is part of **GE-41413-300** to the fresh air side of the Q63 Evaporative Emission System Leak Detection Pump.
 1. Test the connection between the Q13 Evaporative Emission Vent Solenoid Valve and the Q63 Evaporative Emission System Leak Detection Pump for a leak.
 2. The value should be below the 0.020 in H₂O value established above in Circuit/System Verification, step 4.

NOTE: Smoke seen coming out of the fresh air side of the EVAP leak detection pump assembly is not consider a failed part. This includes the electrical connection port as diagnostics will not detect a leak on the fresh air side of the system.

- 3.

- **If a leak is detected**

Repair the affected component

2. Vehicle OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.

3. Test for 25 - 30 Ω between the control terminal 1 and the battery voltage terminal 2.

- **If not within the specified range**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If within the specified range**

NOTE:

- **Use the scan tool Fuel Tank Pressure sensor parameter as a pressure/vacuum reference source.**
- **Review diagnostic aids listed for P0451-P0453 as these could affect further testing.**

•

4. Connect **J 41413-323** to the pump side of the Q13 Evaporative Emission Vent Solenoid Valve

5. Test for no air flow through the Q13 Evaporative Emission Vent Solenoid Valve by applying vacuum to the pump side of the valve. It should hold 1 - 2 in Hg (3 - 7 kPa) for 30 s.

- **If it does not hold vacuum**

Replace the Q13 Evaporative Emission Vent Solenoid Valve.

- **If it does hold vacuum**

6. Reconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve, vehicle in Service Mode.

7. Command the scan tool EVAP Vent Solenoid Valve ON and apply vacuum to the pump side of the valve.

8. Verify the Q13 Evaporative Emission Vent Solenoid Valve does not hold vacuum.

- **If it does hold vacuum**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If it does not hold vacuum**

9. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Evaporative Emission Canister Control Valve Vacuum Hose Replacement](#)
- Refer to [Evaporative Emission System Vacuum Leak Detection Pump Replacement](#)
- Refer to [Evaporative Emission Canister Vent Solenoid Valve Replacement](#)

DTC P1461: EVAPORATIVE EMISSION (EVAP) SYSTEM PRESSURE INCORRECT DURING FUEL FILL DOOR OPEN REQUEST

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.

- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1461

Evaporative Emission (EVAP) System Pressure Incorrect During Fuel Fill Door Open Request

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 (HPCM2) monitors the fuel tank pressure during a fuel fill door open request. If the fuel tank pressure does not fall within a predetermined range within 30 - 120 s this DTC sets.

Conditions for Running the DTC

- The HPCM2 is active.
- The fuel fill door open switch is pressed.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 2 detects the fuel tank pressure sensor reading does not fall within a predetermined value for greater than 30 - 120 s.

Action Taken When the DTC Sets

The DTC P1461 is a type A DTC.

Conditions for Clearing the DTC

The DTC P1461 is a type A DTC.

Diagnostic Aids

- A restriction in the EVAP canister or vent lines that might hold fuel tank pressure could affect this.
- This DTC will not prevent the fuel fill door from opening.
- A vent valve stuck closed could affect this.
- Ensure that the reference port on the fuel tank pressure sensor is unobstructed.
- Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

DTC P1462: EVAPORATIVE EMISSION (EVAP) SYSTEM REFERENCE ORIFICE FLOW ERRATIC

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1462

Evaporative Emission (EVAP) System Reference Orifice Flow Erratic

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The engine control module (ECM) monitors the pressure across the reference orifice with the EVAP leak detection pump pressure sensor. When all conditions are met, the ECM commands the vacuum pump ON and monitors the EVAP leak detection pump pressure sensor. If the ECM detects the pressure is not stabilized, the DTC will set.

Conditions for Running the DTC

- DTCs P043E, P043F, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P111E, P145C, P145D, P145E, P2066, P2067, P2068, P2227, P2228, P2229, P2230, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P24BA, P24BB, P24B9, P2537, P262B, U0073, U0074, U0140 and U182D is not set.
- The vehicle is OFF.
- The propulsion system is not active.
- The refueling request button is not pressed
- A service bay test is not active
- The purge valve is closed
- The vent solenoid valve is closed
- The EVAP Leak Detection Pump switching valve is in the vent position
- The EVAP Leak Detection Pump vacuum pump is ON
- The odometer is greater than 16 km (10 mi)
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI)
- The fuel level is between 10 - 90%
- The engine coolant temperature is less than 40°C (104°F)
- The intake air temperature is between 4 - 45°C (39 - 113°F)
- The system voltage is greater than 10 V
- The vehicle speed less than 4.8 km/h (3 MPH)
- There are three possible time windows for this test to run. Up to that point, and through this time period, the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 h.

Conditions for Setting the DTC

The ECM detects the EVAP leak detection pump internal reference test did not successfully complete within a calibrated value.

Action Taken When the DTC Sets

DTC P1462 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1462 is a Type B DTC.

Diagnostic Aids

- Inspect the tube and clamps from the EVAP leak detection pump to the vent solenoid for damage. A damage/open tube may allow debris to enter the pump and plug the reference orifice.
- Remove the EVAP leak detection pump and look inside the pump opening for any debris that could restrict or plug the reference orifice. The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening. Inspect for missing or damage O-rings.
- With the fresh air tube removed from the EVAP leak detection pump assembly, blow controlled air, 5 - 10 PSI, into this tube. There should be air escaping from behind the fuel fill pocket indicating this tube and filter are not restricted.
- A switching valve stuck in the pump position can cause insufficient flow.
- This part is not serviceable. It is very important that no debris be found in the pump fresh air inlet or vacuum openings, the tube between the vent solenoid valve and EVAP leak detection pump assembly as this could cause a P043E to set.

Powertrain Component Views

Description and Operation

Evaporative Emission Control System Description

Hybrid Modes of Operation Description

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool EVAP Leak Detection Pump Pressure sensor reading is within the range specified in the **Altitude Versus Barometric Pressure** table.

3. Record the EVAP Leak Detection Pump Pressure sensor reading.
4. Command the scan tool EVAP Leak Detection Pump ON.
5. Record the EVAP Leak Detection Pump Pressure sensor reading after 6 min. The reading should be 1.18 - 4 kPa (0.17-0.58 PSI) less than the initial reading from step 2.

- **If not within the specified range**

Refer to Circuit/System Testing

- **If within specified range**

6. Record the EVAP Leak Detection Pump Pressure sensor reading after monitoring for an additional 5-10 min.
7. The reading should be 1.18 - 4.5 kPa (0.17-0.58 PSI) less than the initial reading from step 2, and the difference between the step 4 and step 5 readings less than 0.51 kPa (.07 PSI)

- **If not within the specified range**

Refer to Circuit/System Testing

- **If within specified range**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
9. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC do not set**

10. All OK.

Circuit/System Testing

NOTE: The reference orifice is a small opening at the 2 o'clock position in the pump vacuum opening.

1. Vehicle OFF, remove the Q63 Evaporative Emission System Leak Detection Pump Assembly.
2. Verify the reference orifice within the pump does not have a restriction.

- **If restricted**

Inspect and repair any of the conditions listed below:

- The EVAP leak detection pump to the vent solenoid tube and clamps for damage
- A missing or damage EVAP leak detection pump O-rings
- The fresh air tube near the fuel fill pocket for a restriction
- The fresh air tube for a restriction
- **If not restricted**

Replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Evaporative Emission System Vacuum Leak Detection Pump Replacement](#)

DTC P1426: EXHAUST GAS RECIRCULATION (EGR) VALVE INTERNAL PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P1426

Exhaust Gas Recirculation (EGR) Valve Internal Performance

Circuit/System Description

The exhaust gas recirculation (EGR) valve internal performance DTC indicates that the smart EGR valve has determined that an internal error exists (internal to the EGR valve).

Conditions for Running the DTC

- Engine speed is between 700 - 5,900 RPM
- The DTC runs continuously when the above conditions are met for greater than 5 s.

Conditions for Setting the DTC

P1426

The EGR valve has broadcast the specific duty cycle to the engine control module to indicate internal error condition exists.

Action Taken When the DTC Sets

DTC P1426 is a Type B DTC.

Conditions for Clearing the DTC

DTC P1426 is a Type B DTC.

Typical Scan Tool Data

EGT Sensor 1 - 3

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition On Parameter Normal Range: -39 - 999Â°C (-38 - 1,830Â°F)			
Exhaust Gas Temperature Sensor 1 or 2 Signal	200Â°C (392Â°F)	200Â°C (392Â°F)	200Â°C (392Â°F)

Circuit	Short to Ground	Open	Short to Voltage
Exhaust Gas Temperature Sensor 1 or 2 Low Reference	-	200Â°C (392Â°F)	200Â°C (392Â°F)

Circuit/System Description

The exhaust gas temperature sensors are variable resistors that measure the temperature of the exhaust gas. The Engine Control Module (ECM) supplies a 5 V bias to the exhaust gas temperature sensor (EGT) signal circuit and supplies a ground to the low reference circuit. When the EGR temperature sensor is cold, the sensor resistance is high. When the EGR temperature increases, the sensor resistance decreases. With high sensor resistance, the ECM detects a higher voltage on the EGR temperature signal circuit. With lower sensor resistance, the ECM detects a lower voltage on the EGR temperature signal circuit. After an 8 hour engine off soak time, the power up temperature of the exhaust gas temperature sensors are compared to the engine coolant temperature sensor (ECT) to determine if the temperature is plausible.

The following table illustrates the relationship between the temperature of the exhaust gas, and the resistance and voltage seen at the EGT sensor.

Temperature	Resistance	Voltage
Low	Low	Low
High	High	High

Conditions for Running the DTC

P1427, P1428, P1429, and P142A

- DTC P00E9, P010B, P0111, P0114, P0116, P0117, P0118, P0119, P0128, P017B, P017C, P017D, P111E, P117B, P117C, P117D, P117E, P117F, or P262B is not set.
- Battery voltage is greater than 11 V
- The engine is off for greater than 8 h
- The engine is cranking or running
- The DTCs run once per drive cycle when the above conditions are met

P1437

- Battery voltage is greater than 11 V
- The engine speed is between 700 - 5,900 RPM
- The engine is cranking or running
- The DTC runs continuously when the above conditions are met for 10 s

Conditions for Setting the DTC

P1427, P1428, P1429, and P142A

The ECM detects the difference between the exhaust gas temperature and the engine coolant temperature is greater than 15Â°C (59Â°F) after an 8 h engine soak.

P1437

The exhaust gas recirculation valve (EGR) determines that a thermal condition exists where the valve should be shut down for protection, but the ECM has determined that the condition is not plausible because none of the other engine hot conditions exist.

Action Taken When the DTC Sets

DTCs P1427, P1428, P1429, P142A, and P1437 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1427, P1428, P1429, P142A, and P1437 are Type B DTCs.

Diagnostic Aids

- If the engine has cooled overnight, all exhaust gas temperature sensors and the engine coolant temperature sensor values should display within 3Â°C (5Â°F).
- After starting a cold engine, the exhaust gas temperature sensors temperature should rise steadily, then stabilize after the engine reaches operating temperature.
- High resistance in either circuit of an exhaust gas temperature sensor could set a DTC.
- After a code clear, with an existing fault, the EGR temperature sensors briefly display the Typical Scan Tool Data chart fault values to indicate a fault type, then default to 200Â°C (392Â°F) after a few seconds.
- With a fault present, the sensor reads a software defaulted value of 200Â°C (392Â°F) and does not change with an expected temperature increase or decrease.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no other DTCs are set.
 - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

- **If no other DTCs are set**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, exchange the suspect harness connector at the B130 Exhaust Gas Recirculation Temperature Sensor with the known functioning B130 Exhaust Gas Recirculation Temperature Sensor, vehicle in Service Mode.
2. Verify the DTC related to the known functioning B130 Exhaust Gas Recirculation Temperature Sensor does not set.

- **If the DTC sets**

Test or replace the B130 Exhaust Gas Recirculation Temperature Sensor

- **If the DTC does not set**
3. Vehicle OFF, and all vehicle systems OFF, install original harness connector to the known functioning B130 Exhaust Gas Recirculation Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
 4. Test for less than 10 Ω between the appropriate low reference circuit terminal 2 and ground.

- **If 10 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If less than 10 Ω**

5. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
6. Test for less than 1 V between the signal circuit and ground.

- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

7. Test for infinite resistance between the signal circuit terminal 1 and ground.

- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

8. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

Repair Instructions

DTC P1516

Throttle Actuator Control (TAC) Module Throttle Actuator Position Performance

DTC P2101

Throttle Actuator Position Performance

DTC P2119

Throttle Closed Position Performance

DTC P2176

Minimum Throttle Position Not Learned

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Close	P1516, P2101	P1516, P2101	P1516, P2101	P1516, P2101, P2176
Control - Open	P1516, P2101, P2119	P1516, P2101	P1516, P2101	P1516, P2101, P2176

Circuit/System Description

Circuit	Description
Control - Close	The output circuit is switched from ground to 12 V to activate the component.
Control - Open	The output circuit is switched from ground to 12 V to activate the component.

Component	Description
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.
Q38 Throttle Body	The throttle valve is actuated by a bidirectional DC motor. A spring pulls the valve to a rest or default position, in which the valve is almost closed. The throttle actuator motor can push against the force of the spring to open or close the valve. The more current flow through the motor, the more the valve moves.

The engine control module (ECM) provides the accelerator pedal interface in which the driver requests a vehicle torque. These driver requests are coordinated and arbitrated within the ECM and the final driver requested torque is sent to the hybrid powertrain control module. The hybrid powertrain control module then determines how the torque output will be distributed between the two electric motors and the engine. The ECM achieves throttle positioning by providing a pulse width modulated voltage to the throttle actuator motor.

Conditions for Running the DTC

P1516

- DTC P1682 = Not set
- Ignition Voltage = Greater than 6.4 V
- Throttle Position Learn = Not Activated

DTC runs continuously when the above conditions are met.

P2101 Condition 1

- DTC P1682 = Not set
- Ignition Voltage = Greater than 6.4 V
- Throttle Position Learn = Not Activated
- Engine = Running

Condition 2

- Ignition Voltage = Greater than 6.4 V
- Throttle Position Learn = Active

Condition 3

- Ignition Voltage = Greater than 6.4 V
- Reduced Engine Power = Active

DTC runs continuously when the above conditions are met.

P2119

- DTC P0122, P0123, P0222, P0223, P06A3 = Not set
- Ignition Voltage = Greater than 6.4 V
- Engine = Not Running

DTC runs continuously when the above conditions are met.

P2176

- Ignition Voltage = Greater than 6.4 V
- Throttle Position Learn = Active

DTC runs continuously when the above conditions are met for greater than 2 s.

Conditions for Setting the DTC

P1516

- The following parameters are not within 2% of each other:
 - Desired Throttle Position
 - Throttle Position

DTC P2101 Condition 1

- The following parameters are not within 10% of each other:
 - Desired Throttle Position
 - Throttle Position

Condition 2

- Throttle Position Learn = Active
- Throttle Position = Greater than 38%

Condition 3

- Throttle Position Learn = Active
- Throttle Position = Greater than 50%

P2119

The throttle blade has not reached the closed position after the engine has been turned off.

P2176

Minimum Throttle Position Not Learned = Exceeded Number of Attempts

Actions Taken When the DTC Sets

- DTC P1516 is a Type B DTC.
- DTCs P2101, P2176 are Type A DTCs.
- DTC P2119 is a Type C DTC.
- Reduced Engine Power = Active
- P16 Instrument Cluster = Reduced Engine Power
- Under certain conditions, the control module commands the engine Off.

Conditions for Clearing the DTC

- DTC P1516 is a Type B DTC.
- DTCs P2101, P2176 are Type A DTCs.
- DTC P2119 is a Type C DTC.

Diagnostic Aids

- A high resistance condition on the throttle position and throttle actuator control circuits could cause a DTC to set.
- A weak battery may cause this DTC to set.
- If the throttle blade becomes stuck, a DTC will set. Depending on the position of the throttle blade, the ECM may enter Engine Shutdown Mode. The ECM will disable fuel and de-energize the throttle actuator. If the condition remains present during the next ignition cycle, the ECM may disable engine cranking. Inspect the throttle body assembly for a stuck throttle blade if a throttle actuator DTC is current and the engine won't crank.
- Inspect for a condition in which the throttle blade may have been held open. For example, ice may have formed in the throttle bore causing the throttle blade not to close.
- Under cold start conditions, it might happen briefly that the desired and the actual throttle blade position do not match.

3. Verify the scan tool parameter: Throttle Body Idle Air Flow Compensation = Less than 90%

- **If 90% or greater**

Refer to: [Throttle Body Inspection and Cleaning](#) .

- **If less than 90%**

4. Clear the DTCs.
5. Vehicle Off and all vehicle systems Off.
6. Vehicle in Service Mode.
7. Perform the scan tool control function: Throttle Sweep

Verify the scan tool parameter: TAC Motor = Enabled

- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

8. Verify the scan tool parameter: TAC Motor = Enabled

Perform the action while monitoring the parameter:

- Wiggle the harness and connector: Q38 Throttle Body
- Wiggle the harness and connector: K20 Engine Control Module
- **If not the specified state**

Repair as necessary - Wiring / Terminal(s) / Electrical Connector(s)

- **If the specified state**

9. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

10. Verify the DTC does not set.

- **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC does not set**

11. All OK.

Circuit/System Testing

1. Vehicle Off.

2. Verify the following conditions do not exist:

WARNING: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

- The throttle blade has not reached the closed position after the engine has been turned off.
- The throttle blade is not closed by the spring.
- The throttle blade is binding in open or closed position.
- **If a condition exists**

Replace the component: Q38 Throttle Body

- **If no condition exists**

NOTE: Disconnecting the component electrical connector causes additional DTCs to set.

3. Disconnect the electrical connector: Q38 Throttle Body

4. Vehicle in Service Mode.

5. Test for 6 to 8 V between the test points:

- Control circuit terminal 1 & Ground
- Control circuit terminal 2 & Ground
- **If less than 6 V**

1. Vehicle Off.

2. Disconnect the electrical connector: X2 @ K20 Engine Control Module

3. Test for infinite resistance between the test points:

- Control circuit terminal 1 @ Component harness & Ground
- Control circuit terminal 2 @ Component harness & Ground
- If less than infinite resistance - Repair the short to ground on the circuit.
- If infinite resistance

4. Test for less than 2 ohms between the test points:

- Control circuit terminal 1 @ Component harness & The other end of the circuit @ Control module harness
- Control circuit terminal 2 @ Component harness & The other end of the circuit @ Control module harness
- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K20 Engine Control Module

• **If greater than 8 V**

1. Vehicle Off.

2. Disconnect the electrical connector: X2 @ K20 Engine Control Module

3. Vehicle in Service Mode.

4. Test for less than 1 V between the test points:

- Control circuit terminal 1 @ Component harness & Ground
- Control circuit terminal 2 @ Component harness & Ground
- If 1 V or greater - Repair the short to voltage on the circuit.
- If less than 1 V - Replace the component: K20 Engine Control Module

• **If between 6 and 8 V**

6. Vehicle Off.

7. Disconnect the electrical connector: X2 @ K20 Engine Control Module

8. Test for less than 2 ohms between the test points:

- Control circuit terminal 1 @ Component harness & The other end of the circuit @ Control module harness
- Control circuit terminal 2 @ Component harness & The other end of the circuit @ Control module harness
- **If 2 ohms or greater - Repair the open/high resistance in the circuit.**
- **If less than 2 ohms**

9. Test or replace the component: Q38 Throttle Body

DTC P15F2: ENGINE TORQUE COMMAND SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F2

Engine Torque Command Signal Message Counter Incorrect

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately. The hybrid/EV powertrain control module 1 sends an engine torque requested message to the ECM over the serial data circuits. The ECM monitors the data to verify the indicated engine torque requested calculation is correct. The ECM processor monitors the data to verify that the engine torque command is correct.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is 8 - 18 V.
- DTC U1817 is not set.

Conditions for Setting the DTC

The control module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTC P15F2 is a Type A DTC.
- The hybrid/EV powertrain control module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

DTC P15F2 is a Type A DTC.

Reference Information

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Verification

NOTE: Diagnose and repair any communication DTCs prior to performing this testing.

1. Vehicle in Service Mode.
2. Verify DTC P15F2 is not set.
 - **If the DTC is set**
 1. Program the K20 Engine Control Module.
 2. Verify the DTC does not set.
 - If the DTC sets, replace the K20 Engine Control Module.
 - If the DTC does not set.
 - 3. All OK
3. All OK
 - **If the DTC is not set**

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K20 Engine Control Module replacement, programming, and setup.

DTC P15F9: HYBRID/EV SYSTEM ENGINE SPEED CONTROL INTERVENTION REQUEST TYPE SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for a overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15F9

Hybrid/EV System Engine Speed Control Intervention Request Type Signal Message Counter Incorrect

Circuit/System Description

The hybrid/EV powertrain control module is constantly sending serial data messages to the ECM regarding the operating state of the powertrain propulsion system. These messages are sent in a continuously repeating series of rolling counts with associated password protect samples. Each count/sample is assigned a value. The ECM uses the values, during a propulsion system mode shift, to determine when and at what RPM to idle the internal combustion engine. When the ECM determines that too many of the counts/samples contain an error value, the ECM sets DTC P15F9.

Conditions for Running the DTC

- DTC U1817 is not set.
- The engine run time is greater than 0.5 s.
- No other CAN errors are present.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that 10 of 16 counts/samples contain an error value.

Action Taken When the DTC Sets

DTC P15F9 is a Type B DTC

Conditions for Clearing the DTC

DTC P15F9 is a Type B DTC.

Diagnostic Aids

An intermittent fault in the CAN circuits will cause the ECM to set DTC P15F9.

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P15FB: BRAKE PEDAL POSITION SENSOR SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for a overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P15FB

Brake Pedal Position Sensor Signal Message Counter Incorrect

Circuit/System Description

The electronic brake control module (EBCM) monitors the brake pedal position sensor in order to provide emission related brake pedal position information to the engine control module (ECM). The EBCM sends the information, via the serial data circuit, to the ECM in a continuously repeating series of 16 rolling counts, with each count assigned a value. When the ECM determines that too many of the counts have an incorrect value, the ECM sets DTC P15FB.

Conditions for Running the DTC

- The vehicle is ON.
- DTC P15FB runs continuously when the above condition is met.

Conditions for Setting the DTC

The ECM detects that too many of the rolling counts have an incorrect value.

Action Taken When the DTC Sets

- DTC P15FB is a Type B DTC.
- Brake pedal position is defaulted to 0 for as long as the fault is active.

Conditions for Clearing the DTC

DTC P15FB is a Type B DTC.

Circuit/System Verification

NOTE:

- **DTC P15FB is an informational DTC.**
- **Diagnose all other engine control module DTCs prior to DTC P15FB.**

1. Verify that no other DTCs are set except for DTC P15FB.

- **If any other DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

- **If only DTC P15FB is set**

2. Replace the K17 Electronic Brake Control Module.

3. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.

- **If DTC sets**

Replace the K20 Engine Control Module.

- **If DTC does not set**

4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Refer to Control Module References for Electronic Brake Control Module and Engine Control Module replacement, programming and setup

DTC P162D: EVAPORATIVE EMISSION (EVAP) SYSTEM ALARM CLOCK SIGNAL NOT

RECEIVED

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P162D

Evaporative Emission (EVAP) System Alarm Clock Signal Not Received

Circuit/System Description

Whenever the propulsion system goes active, the diagnostic reads its internal timer and evaluates the results from the wake-up events that could have occurred. If the ECM did not receive feedback from the Hybrid/EV Powertrain Control Module 2 that the alarm clock was set and the ECM did not wake up, then the DTC will set.

Conditions for Running the DTC

- DTC's P0502, P0503, P0722, P0723, P262B, U0140, U182D, U0073, U0074 or P2537 is not set.
- Drive distance of greater than 0.1 mi
- A service bay test is not active

Conditions for Setting the DTC

The vehicle must sit at least 6 h before the system goes to propulsion system active. At propulsion system active, if the ECM did not receive feedback from the Hybrid/EV Powertrain Control Module 2 that the alarm clock was set, and any one of the three wake-up timer events did not occur, then the DTC fails.

Action Taken When the DTC Sets

- The control modules are never signaled; therefore the specific subsystems will not function.
- The MIL will illuminate after the 2nd ignition cycle.

Conditions for Clearing the DTC

DTC P162D is a type B DTC.

- **If DTC P162D is set along with other DTCs set**

Diagnose all other DTCs first. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If DTC P162D is set without other DTCs set**

Refer to Circuit/System Testing.

- **If DTC P162D is not set**

3. All OK.

[Circuit/System Testing](#)

NOTE: Use the schematics and connector end views to identify the following:

- The control modules that share the K20 Engine Control Module terminals X1 29 and 43 High Speed GMLAN and X1 1 and 15 High Voltage Management and Powertrain Expansion Buss serial data circuits.

1. Vehicle OFF, all systems OFF, all keys at least 3 meters away from vehicle, all access doors closed. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K40 Engine Control Module and K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 2 Ω in the serial data circuits end to end between the K20 Engine Control Module and K114B Hybrid/EV Powertrain Control Module 2.

- **If 2 Ω or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 Ω**

Replace the K114B Hybrid/EV Powertrain Control Module 2.

3. Verify that DTC P162D does not set again.

- **If the DTC sets**

Replace the K20 Engine Control Module.

- **If the DTC does not set**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC P163A: CONTROL MODULE FUEL PRESSURE REGULATOR 1 CONTROL SYSTEM CIRCUITRY PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P163A

Control Module Fuel Pressure Regulator 1 Control System Circuitry Performance

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the engine control module (ECM). The ECM monitors the current required to control fuel pressure regulator and compares the current value to calibrated low and high thresholds.

Conditions for Running the DTC

- DTC P0016, P0017, P0090, P0091, P0092, P00C8, P00C9, P00CA, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0192, P0193, P0335, P0336, P0340, P0341, P0365, P0366, P0627, P0628, P0629, or P1682 are not present.
- The engine is running for greater than 10 s.
- Battery voltage is greater than or equal to 11 V.
- Low side fuel pressure is greater than 300 kPa (43.5 PSI).
- Intake air temperature (IAT) is warmer than or equal to -10°C (14°F).

- Barometric pressure is greater than 70 kPa.
- Fuel temperature is between -10°C and +132°C (14°F and 270°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the current used to drive the high pressure fuel pump actuator is 0.1 A or less or 11 A or greater for greater than 11 s.

Action Taken When the DTC Sets

DTC P163A is a Type B DTC.

Conditions for Clearing the DTC

DTC P163A is a Type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no other DTCs are set.
 - **If any other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If no other DTCs are set**

3. Verify DTC P163A is not set.

- **If the DTC is set**

Refer to Circuit/System Testing.

- **If the DTC is not set**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump. It may take up to 2 min for all vehicle systems to power down.

NOTE: **The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.**

2. Test for 1.09 - 1.21 Ω at 20 $^{\circ}\text{C}$ (68 $^{\circ}\text{F}$) between the high control circuit terminal 2 and the low control circuit terminal 1 on the G18 High Pressure Fuel Pump.

- **If not between 1.09 - 1.21 Ω**

Replace the G18 High Pressure Fuel Pump.

- **If between 1.09 - 1.21 Ω**

3. Vehicle in Service Mode.

4. Verify that a test lamp does not illuminate between the high control circuit terminal 2 and ground.

- **If the test lamp illuminates**

1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the high control circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If the test lamp does not illuminate**

5. Verify that a test lamp does not illuminate between the low control circuit terminal 1 and ground.

- **If the test lamp illuminates**

1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
2. Test for less than 1 V between the low control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
- **If the test lamp does not illuminate**
6. Verify that a test lamp does not illuminate between the high control circuit terminal 2 and B+.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the high control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
7. Verify that a test lamp does not illuminate between the low control circuit terminal 1 and B+.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the low control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
8. Remove the test lamp, connect a 3 A fused jumper wire between the high control circuit terminal 2 and ground.
9. Engine Running.
10. Verify the Fuel Pressure Regulator High Control Circuit Low Voltage Test Status transitions from OK to Malfunction.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the fused jumper, disconnect the X3 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the high control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If Malfunction is displayed**
11. Connect a 3 A fused jumper wire between the low control circuit terminal 1 and B+.
12. Verify the Fuel Pressure Regulator Control Circuit High Voltage Test Status transitions from OK to Malfunction.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the fused jumper, disconnect the X3 harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If Malfunction is displayed**

13. Test or replace the G18 High Pressure Fuel Pump.

Component Testing

Static Test

1. Vehicle OFF, disconnect the harness connector at the G18 High Pressure Fuel Pump.

NOTE: The DMM and test leads must be calibrated to 0 Ω in order to prevent misdiagnosis.

2. Test for 1.09 - 1.21 Ω at 20 $^{\circ}$ C (68 $^{\circ}$ F) between the high control circuit terminal 2 and the low control circuit terminal 1.

- **If not between 1.09 - 1.21 Ω**

Replace the G18 High Pressure Fuel Pump.

- **If between 1.09 - 1.21 Ω**

3. Test for infinite resistance between each terminal and the G18 High Pressure Fuel Pump housing.

- **If less than infinite resistance**

Replace the G18 High Pressure Fuel Pump.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Injection Pump Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup

DTC P2096 OR P2097: POST CATALYST FUEL TRIM SYSTEM LOW/HIGH LIMIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2096

Post Catalyst Fuel Trim System Low Limit

DTC P2097

Post Catalyst Fuel Trim System High Limit

Circuit Description

Fuel trim bias is used to keep the post catalyst air/fuel ratio within a predetermined range. This allows optimal catalyst efficiency under various operating conditions. The engine control module (ECM) constantly monitors how lean or rich the fuel trim bias is commanded, to determine if the fuel trim bias is greater than a calibrated amount.

Conditions for Running the DTC

- DTC P0016, P0017, P0030, P0036, P0053, P0054, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0128, P0131, P0132, P0133, P0134, P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P015A, P015B, P0178, P0179, P0201, P0202, P0203, P0204, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P0300, P0301, P0302, P0303, P0304, P0340, P0341, P0365, P0366, P0411, P0442, P0443, P0446, P0449, P0452, P0453, P0455, P0458, P0459, P0496, P0498, P0499, P111E, P1133, P1248, P1249, P124A, P124B, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P219A, P2227, P2228, P2229, P2230, P2269, P2270, P2271, P2440, P2444, or P2A00 is not set.
- The barometric pressure (BARO) is greater than 70 kPa (10.2 PSI).
- The manifold absolute pressure (MAP) is between 0 - 200 kPa (0 - 29 PSI).
- The intake air temperature (IAT) is between -20Â°C and +200Â°C (-4 and +392Â°F).
- The start up engine coolant temperature is warmer than -20Â°C (-4Â°F).
- The fuel control intrusive diagnostics are not active.
- The engine is operating under light acceleration, heavy acceleration, or cruise conditions.
- DTCs P2096 and P2097 run continuously when the conditions above have been met.

Conditions for Setting the DTC

The correction limit for a condition causing a lean or rich air/fuel ratio has been exceeded.

Action Taken when the DTC Sets

DTCs P2096 and P2097 are Type B DTCs.

Conditions for Clearing the MIL/DTC

DTCs P2096 and P2097 are Type B DTCs.

Diagnostic Aids

- The post catalyst fuel trim diagnostic is very sensitive to heated oxygen sensor (HO2S) design. A non-OE sensor or an incorrect part number may cause a DTC to set.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC

to set.

- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no other HO2S or fuel trim DTC is set.
 - **If any other HO2S or fuel trim DTC is set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

- **If no other HO2S or fuel trim DTC is set**
3. Verify DTC P2096 or P2097 is not set.
 - **If a DTC is set**

Refer to Circuit/System Testing.

- **If no DTC is set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.

5. Verify DTC P2096 or P2097 is not set.

- **If a DTC is set**

Refer to Circuit/System Testing.

- **If no DTC is set**

6. All OK.

Circuit/System Testing

Inspect for the conditions listed below:

P2096

- Air intake duct collapsed or restricted.
- Air filter dirty or restricted.
- Objects blocking the throttle body.
- Excessive fuel in the crankcase. Change engine oil as necessary.
- Rich fuel injectors. Refer to [Fuel Injector Diagnosis](#).
- Excessive fuel system pressure. Refer to [Fuel System Diagnosis](#).
- Fuel contamination. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).
- Fuel saturation of the evaporative emissions (EVAP) canister
- Stuck open or leaking EVAP purge valve
- Restricted exhaust. Refer to [Symptoms - Engine Exhaust](#) .
- Improperly operating crankcase ventilation system. Refer to [Crankcase Ventilation System Inspection/Diagnosis](#) .

P2097

- Exhaust system leaks. Refer to [Symptoms - Engine Exhaust](#) .
- Split, kinked, or improperly connected vacuum hoses
- Insufficient fuel in the tank
- Leaks in the air induction system and air intake ducts
- Missing air filter element
- Cracked evaporative canister
- Evaporative pipes plugged, obstructed, or leaking
- Crankcase ventilation system leaking. Refer to [Crankcase Ventilation System Inspection/Diagnosis](#) .
- Engine vacuum leaks
- Low fuel system pressure. Refer to [Fuel System Diagnosis](#).
- Contaminated fuel. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).
- Lean fuel injectors. Refer to [Fuel Injector Diagnosis](#).
- If a condition is found

Repair as necessary.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P2122, P2123, P2127, P2128, OR P2138: ACCELERATOR PEDAL POSITION (APP) SENSOR 1-2 CIRCUIT VOLTAGE/ACCELERATOR PEDAL POSITION (APP) SENSORS 1-2 NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Operating Conditions: The engine is operating. Parameter Normal Range: APP Sensor 2 0.39 - 0.59 V			
APP Sensor 2 5 V Reference	0.00 V	0.00 V	1 - 3 V
APP Sensor 2 Signal	0.00 V	0.00 V	2 - 5 V
APP Sensor 2 Low Reference	-	4 - 5 V	-

Circuit/System Description

The accelerator pedal assembly contains 2 accelerator pedal position (APP) sensors. The APP sensors are mounted to the accelerator pedal assembly and are not serviceable. The APP sensors provide a signal voltage that changes relative to pedal position. The engine control module (ECM) supplies each APP sensor with a 5 V reference circuit, a low reference circuit, and a signal circuit. Both the APP sensors 1 and 2 signal percentages increase as the pedal is depressed, from approximately 0% at rest to above 95% when fully depressed.

The ECM provides the accelerator pedal position or driver torque request to the hybrid powertrain control module. The hybrid powertrain control module determines how the torque output will be distributed between the two electric motors and the engine.

Conditions for Running the DTC

P2122, P2123, P2127, P2128

- DTC P0697 is not set - P2127 or P2128.
- DTC P06A3 is not set - P2122 or P2123.
- The ignition is ON or the engine is running.
- The run/crank voltage is greater than 6.4 V.
- The DTCs run continuously when the above conditions are met.

P2138

- DTCs P06A3, P0697, P2122, P2123, P2127, or P2128 are not set.
- The ignition is ON or the engine is running.
- The run/crank voltage is greater than 6.4 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2122

The ECM detects that the APP sensor 1 voltage is less than 0.46 V for greater than 1 s.

P2123

The ECM detects that the APP sensor 1 voltage is greater than 4.7 V for greater than 1 s.

P2127

The ECM detects that the APP sensor 2 voltage is less than 0.32 V for greater than 1 s.

P2128

The ECM detects that APP sensor 2 voltage is greater than 2.6 V for greater than 0.5 s.

P2138

The voltage difference between APP sensor 1 and APP sensor 2 exceeds a predetermined value for greater than 1 s.

Action Taken When the DTC Sets

- DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.
- A message center displays Propulsion Power is Reduced.

Conditions for Clearing the DTC

DTCs P2122, P2123, P2127, and P2128, and P2138 are Type A DTCs.

Diagnostic Aids

- A high resistance condition on the accelerator pedal sensor circuits could cause a DTC to set.
- Ensure that the in-line harness connector seals are installed correctly. Improper installation could result in water intrusion into the connector and cause a DTC to set.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0697 or P06A3 is not set.

- **If any of the DTCs are set**

Refer to **DTC P0641, P0651, P0697, P06A3, or P06D2** for further diagnosis.

- **If none of the DTCs are set**

3. Verify the APP Sensor 1 Circuit Status and APP Sensor 2 Circuit Status displays OK.

- **If Malfunction is displayed**

Refer to Circuit/System Testing

- **If OK is displayed**

4. Verify the scan tool APP Sensor 1 and 2 Agree/Disagree parameter displays Agree while performing the tests listed below:

- Rapidly depress the accelerator pedal from the rest position to the wide open throttle position (WOT) and release pedal. Repeat the procedure several times.
- Slowly depress the accelerator pedal to WOT and then slowly return the pedal to closed throttle. Repeat the procedure several times.
- **If Disagree**

Refer to Circuit/System Testing

- **If Agree**

5. Verify that DTC P2122, P2123, P2127, P2128, or P2138 is not set.

- **If any of the DTCs are set**

Refer to Circuit/System Testing

- **If none of the DTCs set**

6. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

7. Verify DTC P2122, P2123, P2127, P2128, or P2138 is not set.

- **If any DTC sets**

Refer to Circuit/System Testing

- **If no DTCs set**

8. All OK

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B107 accelerator pedal assembly. It may take up to 2 minutes for all vehicle systems to power down.

2. Test for less than 5 Ω between each low reference circuit terminal listed below and ground.

- Low reference circuit terminal 4 or A
- Low reference circuit terminal 5 or D

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 engine control module.

- **If less than 5 Ω**

3. Vehicle in Service Mode.

4. Test for 4.8 - 5.2 V between each 5 V reference circuit terminal listed below and ground.

- 5 V reference circuit terminal 1 or C
- 5 V reference circuit terminal 2 or F

- **If less than 4.8 V**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.

2. Test for infinite resistance between the 5 V reference circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the 5 V reference circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 engine control module.

- **If greater than 5.2 V**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

- **If between 4.8 - 5.2 V**

5. Verify each APP sensor voltage parameter is less than 0.2 V.

- **If 0.2 V or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminal listed below and ground.
 - APP sensor 1 signal circuit terminal 3 or E
 - APP sensor 2 signal circuit terminal 6 or B
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 engine control module.

- **If less than 0.2 V**

6. Install a 3 A fused jumper wire between each signal circuit terminal listed below and the 5 V reference circuit terminal 1.
 - APP sensor 1 signal circuit terminal 3 or E
 - APP sensor 2 signal circuit terminal 6 or B
7. Verify the scan tool APP sensor voltage parameter is greater than 4.8 V.

- **If 4.8 V or less**

1. Vehicle OFF, disconnect the harness connector at the K20 engine control module.
2. Test for infinite resistance between the signal circuit terminal and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 engine control module.

- **If greater than 4.8 V**

8. Test or replace the B107 accelerator pedal assembly.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Accelerator Pedal Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming, and setup

DTC P2199: INTAKE AIR TEMPERATURE (IAT) SENSOR 1-2 NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2199

Intake Air Temperature (IAT) Sensor 1-2 Not Plausible

Diagnostic Fault Information

IAT Sensor 1

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0112, P0114, P2199	P0111, P0113, P0114, P2199	P0113*, P0114, P2199	P0111, P2199
Low Reference	-	P0113, P2199, P2227, P2229	P0113*, P0114	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

IAT Sensor 2 and Intake Air Humidity

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0096, P0097, P00F4, P0102, P2199	P0096, P0097, P00F4, P0102, P2199	-	P0096
Signal	P0097, P00F4, P2199	P0097, P00F4, P2199	P0097*, P00F4*, P2199*	P0096
Ground	-	P0096, P0097, P00F4, P0102, P2199	-	P0096
*Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

IAT Sensor 1

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running Parameter Normal Range: Varies with ambient temperature			
Signal	150Â°C (302Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

IAT Sensor 2 and Intake Air Humidity

Circuit	Short to Ground	Open or High Resistance	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: Varies with ambient humidity, temperature, and engine bay conditions			
Ignition Voltage	-40Â°C (-40Â°F) 10 Hz 0%	-40Â°C (-40Â°F) 10 Hz 0%	-
Signal	-40Â°C (-40Â°F) 10 Hz 100%	-40Â°C (-40Â°F) 10 Hz 0%	-40Â°C (-40Â°F) 10 Hz* 0%
Ground	-	-40Â°C (-40Â°F) 10 Hz 0%	-
*Internal ECM or sensor damage may occur if the circuit is shorted to B+			

Circuit/System Description

The intake air temperature (IAT) sensor 1 is a variable resistor that measures the temperature of the air in the sensor bore. The engine control module (ECM) supplies 5 V to the IAT sensor 1 signal circuit and a ground for the IAT sensor 1 low reference circuit. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F).

The IAT sensor 2 produces a frequency signal, based on the inlet air temperature, which is equal to the humidity present within the sensor bore. The signal varies with inlet air temperature and is displayed by the scan tool as Â°C (Â°F) and Hertz (Hz) and the relative humidity is displayed in percent (%). The ECM supplies a regulated voltage to the signal circuit. The signal circuit is shared by the IAT sensor 2 and the humidity sensor. Ignition voltage and ground circuits are also supplied to the multifunction intake air sensor's internal circuits for these sensors:

- IAT sensor 2
- Humidity sensor
- MAF sensor

The multifunction intake air sensor houses the following:

- IAT sensor 1
- IAT sensor 2
- Humidity sensor
- MAF sensor

- BARO pressure sensor

IAT Sensor 1 - Temperature, Resistance, Voltage Table

IAT Sensor 1	IAT Sensor 1 Resistance	IAT Sensor 1 Signal Voltage
Cold	High	High
Warm	Low	Low

IAT Sensor 2 - Temperature, Frequency Table

IAT Sensor 2	IAT Sensor 2 Frequency	IAT Sensor 2 Temperature
Cold	45 Hz	-40Â°C (-40Â°F)
Warm	302 Hz	104Â°C (219Â°F)

Conditions for Running the DTC

- The ignition is ON.
- Ignition 1 voltage is at least 11 V.
- This DTC runs continuously within the enabling conditions.

Conditions for Setting the DTC

The ECM detects that the absolute difference between the IAT sensor 1 and the IAT sensor 2 temperatures is greater than 55Â°C (99Â°F) for longer than 5 s.

Action Taken When the DTC Sets

DTC P2199 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P2199 is a Type B DTC.

Diagnostic Aids

- With the ignition ON, the engine OFF, if the engine is cold, a properly functioning IAT sensor 2 will gradually increase the scan tool IAT Sensor 2 parameter. This is due to the heat that is generated by the multifunction intake air sensor heating elements.
- The humidity sensor and the IAT sensor 2 signals are sent to the ECM on the same circuit. If the IAT Sensor 2 parameter displays the values: 10 Hz; -40Â°C (-40Â°F), and there are Humidity Sensor DTCs, check for a circuit problem.

Special Tools

EL-38522-A Variable Signal Generator

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

1. Vehicle in Service Mode
2. Verify that DTC P0097, P0098, P0099, P00F4, P00F5, P00F6, P0102, P0103, P0112, P0113, P0114, P0641, P0651, P0697, P06A3 or P06D2 is not set.

- **If any of the DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If none of the DTCs are set**

NOTE: To minimize the effects of residual engine heat and sensor internal heating elements, perform Steps 3 and 4 of this verification procedure only if the ignition has been OFF for 8 hours or more.

3. Ignition ON.
4. Verify the following scan tool parameters are within 30Â°C (54Â°F) of each other.
 - Start-Up IAT Sensor 1
 - IAT Sensor 2
 - **If not within 30Â°C (54Â°F)**

Refer to Circuit/System Testing.

- **If within 30Â°C (54Â°F)**

5. Vehicle ON, verify the following scan tool parameters are between: -38 and +149Â°C (-36 and +300Â°F).

- IAT Sensor 1
- IAT Sensor 2
- **If not between: -38 and +149Â°C (-36 and +300Â°F)**

Refer to Circuit/System Testing.

- **If between: -38 and +149Â°C (-36 and +300Â°F)**

6. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.

7. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

8. All OK

Circuit/System Testing

NOTE: You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.

1. Check the integrity of the entire air induction system and verify that none of the following conditions exist:

- A restricted or collapsed air intake duct
- An intake manifold leak
- A misaligned or damaged air intake duct
- Any water intrusion in the induction system
- **If a condition exists**

Repair or replace component as appropriate.

- **If no condition exists**

2. Vehicle OFF, and all vehicle systems OFF, it may take up to 2 min. for all vehicle systems to power down. Disconnect the harness connector at the B75C Multifunction Intake Air sensor.

3. Test for less than 5 Ω between the low reference circuit terminal 3 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for less than 2 Ω in the low reference circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω replace the K20 Engine Control Module.

- **If less than 5 Ω**

4. Vehicle OFF, all vehicle systems OFF, test for less than 5 Ω between the ground circuit terminal 7 and ground.

- **If 5 Ω or greater**

1. Vehicle OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open or high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 5 Ω**

5. Vehicle in Service Mode.

6. Verify that a test lamp illuminates between the ignition circuit terminal 5 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp, the fuse for the ignition voltage circuit, and disconnect all components on the circuit.

2. Test for less than 2 Ω in the ignition voltage circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp and remove the fuse for the ignition voltage circuit.

2. Test for infinite resistance between the ignition voltage circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, test all components connected to the ignition circuit, replace as necessary.

- **If a test lamp illuminates**

7. Vehicle in Service Mode.

8. Verify the scan tool Intake Air Temperature Sensor 1 parameter is colder than -39°C (-38°F).

- **If warmer than -39°C (-38°F).**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the signal circuit terminal 1 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K20 Engine Control Module.

- **If colder than -39°C (-38°F).**

9. Vehicle OFF, install a 3 A fused jumper wire between the IAT 1 signal circuit terminal 1 and the low reference circuit terminal 3, vehicle in Service Mode.

10. Verify the scan tool Intake Air Temperature Sensor 1 parameter is warmer than 148°C (298°F).

- **If colder than 148°C (298°F).**

1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.

- If less than 1 V

3. Vehicle OFF.

4. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If warmer than 148 $^{\circ}$ C (298 $^{\circ}$ F).**

11. Vehicle in Service Mode.

NOTE: The intake air temperature sensor 2 signal circuit is pulled up with low current voltage within the controller. Normally, a voltage near B+ can be measured on the circuit with a DMM, but the current will not be high enough to illuminate a test lamp.

12. Verify the scan tool Intake Air Humidity Sensor parameter is less than 1%.

- **If 1% or greater**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.

2. Test for infinite resistance between the IAT 2 signal circuit terminal 8 and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the K20 Engine Control Module.

- **If less than 1%**

13. Vehicle OFF, install a 3 A fused jumper wire between the IAT 2 signal circuit terminal 8 and the low reference circuit terminal 3, vehicle in Service Mode.

14. Verify the scan tool Intake Air Humidity Sensor parameter is greater than 99%.

- **If 99% or less**

NOTE: If the signal circuit is shorted to a voltage the engine control module or the sensor may be damaged.

1. Vehicle OFF, remove the jumper wire and disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.

2. Test for less than 1 V between the IAT 2 signal circuit terminal 8 and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V.

3. Vehicle OFF.

4. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 99%**

15. Test or replace the B75C Multifunction Intake Air sensor.

Component Testing

Multifunction Intake Air Sensor

1. Vehicle OFF, disconnect the harness connector at the B75C Multifunction Intake Air Sensor.
2. Connect a DMM between the IAT sensor 1 signal terminal 1 and the low reference terminal 3

NOTE: A thermometer can be used to test the sensor off the vehicle.

3. Test the IAT sensor 1 by varying the sensor temperature while monitoring the sensor resistance. Compare the readings with the [Temperature Versus Resistance - Intake Air Temperature Sensor \(Hitachi sensor\)](#) table for Hitachi Sensors. The resistance values should be in range of the table values.

- **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.

- **If within the specified range**

4. All OK.

Multifunction Intake Air Sensor

1. Test the IAT Sensor 2 by varying the sensor temperature while monitoring the air temperature with a thermometer. Compare the readings with the scan tool IAT Sensor 2 parameter. The values should be within 5%.

- **If not within the specified range**

Replace the B75C Multifunction Intake Air Sensor.

- **If within the specified range**

2. All OK.

Dynamic Testing

NOTE: In-correct diagnosis will result if Circuit/System Testing is not completed before performing the following test.

1. Perform the following test using a **EL-38522-A** Variable Signal Generator or equivalent, if available.
2. Vehicle OFF, connect the leads of the **EL-38522-A** Variable Signal Generator as follows:
 1. Red lead to the signal circuit terminal 8 at the harness connector
 2. Black leads to ground
 3. Battery voltage supply lead to B+
3. Set the **EL-38522-A** Variable Signal Generator to the following specifications.
 - Signal switch to 5 V
 - Duty Cycle switch to 50% (Normal)
 - Frequency switch to 250 Hz
4. Vehicle in Service Mode.
5. Verify the scan tool IAT Sensor 2 parameters listed below are within the ranges listed below:

- IAT Sensor 2 is between 248 - 252 Hz

NOTE: Changing the frequency should cause a warmer or colder IAT 2 temperature.

- IAT Sensor 2 is between 70 - 76°C (160 - 166°F)

NOTE: Increasing or decreasing the duty cycle should have an inverse affect on humidity.

- Intake Air Humidity Sensor is between 48 - 52%
- **If a parameter is not within the specified range**

Replace the K20 Engine Control Module.

- **If all the parameters are within the specified range**

6. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Mass Airflow Sensor Replacement](#) for multifunction intake air sensor replacement
- Refer to [Control Module References](#) for engine control module replacement, programming, and setup.

DTC P219A: FUEL TRIM CYLINDER BALANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P219A

Fuel Trim Cylinder Balance

Circuit/System Description

The Fuel Trim Cylinder Balance diagnostic detects a rich or lean cylinder to cylinder air/fuel ratio imbalance. The diagnostic monitors the pre-catalyst heated oxygen sensor (HO2S) signal's frequency and amplitude characteristics by calculating an accumulated voltage over a predetermined sample period. An imbalance is indicated when multiple samples of the accumulated voltage are consistently higher than the desired value.

Conditions for Running the DTC

- DTCs P0016, P0017, P0030, P0036, P0053, P0054, P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0019, P0122, P0123, P0128, P0131-P0135, P0137, P0138, P013A, P013B, P013E, P013F, P0140, P0141, P0171, P0172, P0201-P0204, P0222, P0223, P0261, P0262, P0264, P0265,

P0267, P0268, P0270, P0271, P0300, P0301-P0304, P0340, P0341, P0365, P0366, P0411, P0442, P0455, P0458, P0496, P111E, P1133, P1248, P1249, P124A, P124B, P16A0, P16A1, P16A2, P16F3, P2101, P2135, P2147, P2148, P2150, P2151, P2153, P2154, P2156, P2157, P2270, P2271, P2440, P2444 or P2A00 are not set.

- The evaporative emission system device control and intrusive diagnostics are not active.
- The engine overspeed protection is not active.
- The engine is in closed loop status.
- The system voltage is greater than 11 V.
- The engine coolant temperature (ECT) is warmer than -20Â°C (-4Â°F).
- The engine speed is between 1,200 - 4,000 RPM.
- The mass air flow is between 0 - 100 g/s.
- The secondary air injection pump (if equipped) is not ON.
- The Exhaust Camshaft Position and Intake Camshaft Position are between 0 - 35 degrees.
- Engine run time is greater than 30 s.
- Fuel level is greater than 10% and no fuel level sensor fault is present.
- The DTC runs continuously when the above conditions have been met.

Conditions for Setting the DTC

Multiple samples of the pre-catalyst HO2S accumulated voltage are consistently greater than the desired value.

Action Taken When the DTC Sets

DTC P219A is a Type A DTC.

Conditions for Clearing the MIL/DTC

DTC P219A is a Type A DTC.

Diagnostic Aids

- The fuel trim cylinder balance diagnostic is very sensitive to heated oxygen sensor (HO2S) design. A non-OE sensor or an incorrect part number may cause a DTC to set.
- Monitoring the misfire current counters, or misfire graph, may help to isolate the cylinder that is causing the condition.
- Certain aftermarket air filters may cause a DTC to set.
- Certain aftermarket air induction systems or modifications to the air induction system may cause a DTC to set.
- Certain aftermarket exhaust system components may cause a DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify no other DTCs are set.
 - **If any other DTCs are set**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

- **If no other DTCs are set**
3. Verify DTC P219A is not set.
 - **If the DTC is set**

Refer to Circuit/System Testing.

- **If the DTC is not set**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed in the Freeze Frame/Failure Records data.
 5. Verify DTC P219A is not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
6. All OK.

Circuit/System Testing

1. Engine running, transmission in Park or Neutral.
2. Verify the manifold absolute pressure (MAP) sensor parameter is between 20 - 48 kPa.

- **If not within the specified range .**

Refer to [DTC P0106](#) .

- **If within the specified range**

3. Inspect for the conditions listed below:

- Modified, damaged, leaking, or restricted air induction system components.
- Improperly operating crankcase ventilation system. Refer to [Crankcase Ventilation System Inspection/Diagnosis](#) .
- Split, kinked, or improperly connected vacuum hoses.
- Restricted, damaged, leaking, or modified exhaust system from the catalytic converter forward. Refer to [Symptoms - Engine Exhaust](#) .
- Improperly operating fuel injectors. Refer to [Fuel Injector Diagnosis](#).
- Fuel contamination. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).
- Excessive fuel in the crankcase due to leaking injectors. Change engine oil as necessary.
- Improperly operating ignition system. Refer to [Electronic Ignition System Diagnosis](#).
- **If a condition is found**

Repair as necessary.

- **If no condition is found**

Test the engine for any mechanical conditions such as sticking valves, lifters, etc., which could alter the flow into the combustion chamber. Refer to [Symptoms - Engine Mechanical](#) .

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Perform the scan tool Fuel Trim Reset after completing the repair.

DTC P2227-P2230: BAROMETRIC PRESSURE (BARO) SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

NOTE: This procedure may also diagnose malfunctions that are not detected by a DTC.

Circuit/System Description

Circuit	Description
5 V Reference	Regulated voltage supplied by the control module.
Signal	The control module input circuit has an internal resistance connected to 5 V.
Low Reference	Grounded through the control module.

Component	Description
B75C Multifunction Intake Air Sensor	The assembly has several functions:

Component	Description
	- The mass air flow sensor is a hot film type sensor that measures the mass of air (not the volume) entering the engine. The signal varies with engine load and is displayed by the scan tool in Hertz (Hz) and grams per second (g/s). - The intake air humidity sensor uses the same signal circuit as the intake air temperature sensor 2. The intake air humidity sensor modulates the pulse width of the signal. The intake air temperature sensor 2 modulates the frequency of the signal. That means the signal is both, PWM and FM modulated. - The barometric pressure sensor generates an analog voltage that is proportional to the ambient air pressure. - The intake air temperature sensor 1 varies its resistance depending on the temperature. - Low temperature produces a high resistance: 5.6 kohms @ 0°C (32°F) - High temperature produces a low resistance: 187 ohms @ 100°C (212°F)
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.

Component	Description
B75C Multifunction Intake Air Sensor	The barometric pressure sensor generates an analog voltage that is proportional to the ambient air pressure.
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.

The barometric pressure sensor is integrated into the multifunction intake air sensor.

Conditions for Running the DTC

P2227 Condition 1

- DTC P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0121, P0122, P0123, P0222, P0223, P1516, P2101, P2135, P2228, P2229 = Not set
- Engine Running = For greater than 30 s

Condition 2

- DTC P0106, P0107, P0108, P2228, P2229, P2230, P2610 = Not set

- Ignition = On
- Engine Off = For greater than 6 min

DTC runs continuously when the above conditions are met.

P2228, P2229

Engine Running = For greater than 30 s

DTC runs continuously when the above condition is met.

P2230

- DTC P0068, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0121, P0122, P0123, P0222, P0223, P1516, P2101, P2135, P2228, P2229 = Not set
- Ignition = On

DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P2227 Condition 1

BARO & Calculated BARO = Not within 15 kPa (2.2 PSI) of each other.

Condition 2

BARO & Calculated BARO = Not within 20 kPa (3.0 PSI) of each other.

P2228

BARO = Less than 2 V - For greater than 5 s

P2229

BARO = Greater than 4.5 V - For greater than 5 s

P2230

BARO = Signal noisy or erratic - For greater than 5 s

Actions Taken When the DTC Sets

DTCs P2227, P2228, P2229, P2230 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P2227, P2228, P2229, P2230 are Type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P0106, P0107, P0108, P0641, P0651, P0697, P06A3 is not set.
 - If any of the DTCs are set
3. Determine the current vehicle testing altitude.
4. Verify the scan tool parameter: MAP Sensor = The value should be within the range listed in the table:

Altitude Versus Barometric Pressure

- **If not in the specified range**

Refer to: [DTC P0106](#)

- **If in the specified range**

5. Verify the scan tool parameter: BARO = The value should be within the range listed in the table: [Altitude Versus Barometric Pressure](#)

- **If not in the specified range**

Refer to: Circuit/System Testing

- **If in the specified range**

6. Verify the scan tool parameter: BARO = The value should not spike or drop out.

Perform the action while monitoring the parameter:

- Wiggle the harness and connector: B75C Multifunction Intake Air Sensor
- Wiggle the harness and connector: K20 Engine Control Module
- If the value spikes or drops out

Repair as necessary - Wiring / Terminal(s) / Electrical Connector(s)

- If the value does not spike or drop out

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

8. Verify the DTC does not set.

- **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC is not set**

9. All OK.

Circuit/System Testing

NOTE: It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.

1. Vehicle Off and all vehicle systems Off.

2. Disconnect the electrical connector: B75C Multifunction Intake Air Sensor

3. Test for less than 10 ohms between the test points: Low Reference circuit terminal 3 & Ground

- **If 10 ohms or greater**

1. Disconnect the electrical connector: K20 Engine Control Module

2. Test for less than 2 ohms between the test points: Low Reference circuit terminal 3 @ Component harness & Terminal 43 X2 @ Control module harness

- If 2 ohms or greater - Repair the open/high resistance in the circuit.
- If less than 2 ohms - Replace the component: K20 Engine Control Module

- **If less than 10 ohms**

4. Vehicle in Service Mode.

5. Test for 4.8 to 5.2 V between the test points: 5 V Reference circuit terminal 2 & Low Reference circuit terminal 3

- **If less than 4.8 V**

1. Vehicle Off.

2. Disconnect the electrical connector: K20 Engine Control Module
3. Test for infinite resistance between the test points: 5 V Reference circuit terminal 2 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance
4. Test for less than 2 ohms between the test points: 5 V Reference circuit terminal 2 @ Component harness & Terminal 14 X3 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K20 Engine Control Module
- **If greater than 5.2 V**
1. Vehicle Off.
2. Disconnect the electrical connector: K20 Engine Control Module
3. Vehicle in Service Mode.
4. Test for less than 1 V between the test points: 5 V Reference circuit terminal 2 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V - Replace the component: K20 Engine Control Module
- **If between 4.8 and 5.2 V**
6. Verify the scan tool parameter: BARO = Greater than 4.7 V
 - **If 4.7 V or less**
 - 1. Vehicle Off.
 - 2. Disconnect the electrical connector: K20 Engine Control Module
 - 3. Test for infinite resistance between the test points: Signal circuit terminal 4 @ Component harness & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K20 Engine Control Module
 - **If greater than 4.7 V**
7. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 4 & Low Reference circuit terminal 3
8. Verify the scan tool parameter: BARO = Less than 0.2 V
 - **If 0.2 V or greater**
 - 1. Vehicle Off, remove jumper wire.
 - 2. Disconnect the electrical connector: K20 Engine Control Module
 - 3. Vehicle in Service Mode.
 - 4. Test for less than 1 V between the test points: Signal circuit terminal 4 @ Component harness & Ground
 - If 1 V or greater - Repair the short to voltage on the circuit.
 - If less than 1 V
 - 5. Vehicle Off.

6. Test for less than 2 ohms between the test points: Signal circuit terminal 4 @ Component harness & Terminal 46 X3 @ Control module harness
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K20 Engine Control Module
- **If less than 0.2 V**

9. Test or replace the component: B75C Multifunction Intake Air Sensor

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- For control module replacement, programming, and setup refer to: [Control Module References](#)

DTC P2400-P2402: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P2400

Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit

DTC P2401

Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit Low Voltage

DTC P2402

Evaporative Emission (EVAP) System Leak Detection Pump Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P2400, P2419	P2400, P2418	-
Control	P2401	P2400	P2402

Circuit/System Description

The evaporative emission (EVAP) system uses an EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve

- EVAP leak detection pump pressure sensor

The ECM commands the EVAP leak detection pump control circuit through an internal switch called a driver. The ECM monitors the commanded and actual status of the driver. If the ECM detects they do not match a DTC sets.

Conditions for Running the DTC

P2400, P2401

- Voltage low during driver OFF state
- The DTC's run continuously when the above conditions are met

P2402

- Voltage high during driver ON state
- The DTC's run continuously when the above conditions are met

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 0.25 s.

Action Taken When the DTC Sets

DTCs P2400, P2401 and P2402 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P2400, P2401 and P2402 are Type B DTCs.

Diagnostic Aids

- The EVAP leak detection pump is very quiet. You might feel it running rather than hear it.
- The devices have to be in their commanded state.
- Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.

[Circuit/System Testing](#)

1. Vehicle OFF, disconnect the harness connector at the Q63 Evaporative Emission System Leak Detection

Pump Assembly.

2. Vehicle in Service Mode,
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.
 2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the B+ voltage circuit for a short and replace as necessary.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
4. Remove the test lamp.
5. Verify the EVAP Leak Detection Pump Output Circuit High Voltage Test Status is OK when commanding the EVAP Leak Detection Pump ON and OFF with a scan tool.
 - **If OK is not displayed**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If OK is displayed**
6. Install a 3 A fused jumper wire between the control circuit terminal 4 and the B+ circuit terminal 3.
7. Verify the EVAP Leak Detection Pump Output Circuit High Voltage Test Status parameter displays Malfunction when commanding the EVAP Leak Detection Pump ON with a scan tool.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.

- If less than 2 Ω replace the K20 Engine Control Module.
- **If Malfunction is displayed**

8. Test or replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Evaporative Emission System Vacuum Leak Detection Pump Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P2418-P2420: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP SWITCHING VALVE CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P2418

Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit

DTC P2419

Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit Low Voltage

DTC P2420

Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Control Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
B+	P2400, P2419	P2400, P2418	-
Control	P2419	P2418	P2420

Circuit/System Description

The evaporative emission (EVAP) system uses an EVAP Leak Detection Pump to test for system leaks. The EVAP Leak Detection Pump assembly consists of the following components:

- EVAP Leak Detection Pump with reference orifice
- EVAP Leak Detection Pump pressure sensor
- EVAP Leak Detection Pump switching valve

The engine control module (ECM) commands the EVAP leak detection pump switching valve to vent or not venting, pumping, position by a switch called a driver. The ECM monitors the commanded state of the driver and the actual state of the control circuit. If they do not match it sets a DTC. The switching valve is located inside the EVAP leak detection pump and is non-serviceable.

Conditions for Running the DTC

The DTCs P2418, P2419 and P2420 run continuously when the above conditions are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for a minimum of 5 s.

Action Taken When the DTC Sets

DTCs P2418, P2419 and P2420 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P2418, P2419 and P2420 are Type B DTCs.

Diagnostic Aids

- Where multiple DTCs set look for a common root cause like battery feeds, grounds, splices, etc.
- Indeterminate state will display if the device is not in a commanded state. This is not to be considered a failure. Use the scan tool to exercise the device.

 Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the Q63 Evaporative Emission System Leak Detection Pump Assembly, vehicle in Service Mode.
2. Verify that a test lamp illuminates between the B+ circuit terminal 5 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, remove the test lamp.

2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to this voltage circuit for a short and replace as necessary.
 - **If the test lamp illuminates**
3. Verify that a test lamp does not illuminate between the B+ circuit terminal 5 and the control circuit terminal 1.
 - **If the test lamp illuminates**
 1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If the test lamp does not illuminate**
4. Remove the test lamp.
5. Verify the scan tool EVAP Leak Detection Pump Switching Valve Output Circuit High Voltage Test Status parameter displays OK when commanding the EVAP Leak Detection Pump Switching Valve On with a scan tool.
 - **If OK is not displayed**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle ON.
 2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If OK is displayed**
6. Install a 3 A fused jumper wire between the control circuit terminal 1 and the B+ circuit terminal 5.
7. Verify the scan tool EVAP Leak Detection Pump Switching Valve Control Circuit High Voltage Test Status parameter is Malfunction when commanding the EVAP Leak Detection Pump Switching Valve On with a scan tool.
 - **If Malfunction is not displayed**
 1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω replace the K20 Engine Control Module.
 - **If Malfunction is displayed**
8. Test or replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Evaporative Emission System Vacuum Leak Detection Pump Replacement**

- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P2422: EVAPORATIVE EMISSION (EVAP) VENT SOLENOID VALVE STUCK CLOSED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P2422

Evaporative Emission (EVAP) Vent Solenoid Valve Stuck Closed

Circuit/System Description

The EVAP vent solenoid valve controls fresh airflow into the EVAP canister. Battery voltage is supplied to the normally closed evaporative emission (EVAP) vent solenoid valve. The ECM commands the solenoid valve open (venting) or closed (not venting) by grounding the EVAP vent solenoid valve output circuit through an internal switch called a driver. The ECM monitors the EVAP leak detection pump pressure sensor, gauge, to determine if a EVAP system pressure (vacuum) is near or above the reference pressure (vacuum) after a calibrated period of time. The ECM uses this reference to determine if the valve is stuck and sets the DTC when the vacuum exceeds a calibrated threshold.

Conditions for Running the DTC

- DTCs P043E, P043, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P145C, P145D, P145E, P0222, P0223, P0449, P0451, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1458, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, U182D is not set.
- The EVAP purge valve is closed
- The EVAP vent solenoid transitions from closed to open to closed
- The EVAP leak detection pump switching valve in not venting, pump position
- The EVAP leak detection pump is ON
- The odometer greater than 15.9 km (9.9 mi)
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI)
- The fuel level is between 10 - 90%
- The engine coolant temperature less than 40°C (104°F)
- The intake air temperature is between 4 - 45°C (39 - 113°F)
- The system voltage greater than 10 V
- The vehicle speed less than 4.8 km/h (3 MPH)
- There is no key up during test
- The refueling request button is not pressed

- The service bay test is not active
- The device control exceeds 0.5 s
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 6.0, 8.0 or 11.0 hours.

Conditions for Setting the DTC

Sufficient pressure or vacuum exist in the fuel tank system.

- The fuel tank pressure sensor indicates a pressure greater than 0.697 kPa (0.1 PSI) or a vacuum less than -0.697 kPa (-0.1 PSI) and the vent solenoid is commanded OPEN.
- The change in the fuel tank pressure sensor reading is less than 1 kPa (0.15 PSI) after 10 s.

Or

- No pressure or vacuum exists in the fuel tank system
- The fuel tank pressure sensor indicates a pressure less than 0.697 kPa (0.1 PSI) or a vacuum greater than -0.697 kPa (-0.1 PSI) and the vent solenoid is commanded OPEN
- The EVAP leak detection pump is commanded ON
- The 0.020" reference orifice vacuum measurement minus the EVAP leak detection pump sensor, gauge, vacuum reading is less than 0.3 kPa (0.04 PSI) after 5 s.

Action Taken When the DTC Sets

DTC P2422 is a Type B DTCs.

Conditions for Clearing the DTC

DTC P2422 is a Type B DTCs.

Diagnostic Aids

- A P0451 or P0497 can set with the Vehicle ON, the engine running and a stuck valve.
- A P0451 or P2422 can set with the Vehicle in Service Mode and a stuck valve.

- GE 41413-A Evaporative Emissions System Tester

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

[Circuit/System Verification](#)

1. Vehicle in Service Mode.
2. Verify DTC P0449, P0498, or P0499 is not set

- **If any of the DTCs are set**

Refer to [DTC P0449, P0498, or P0499](#).

- **If none of the DTCs are set**

3. Verify the parameters listed below do not display Malfunction when commanding the EVAP Vent Solenoid Valve On and Off with a scan tool.

- EVAP Vent Solenoid Valve Output Circuit High Voltage Test Status
- EVAP Vent Solenoid Valve Output Circuit Open Test Status
- EVAP Vent Solenoid Valve Output Circuit Low Voltage Test Status

- **If Malfunction is displayed**

Refer to Circuit/System Testing

- **If Malfunction is not displayed**

4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

NOTE: Perform the Circuit/System Verification before proceeding with the Circuit/System Testing.

1. Verify a blockage or restriction does not exist in the EVAP system components listed below.

- Evaporative Emission Vent System Hoses
- Evaporative Emission Canister
- Q13 Evaporative Emission Vent Solenoid Valve
- Evaporative Emission Vent Filter
- **If a condition exists**

Repair or replace the component as necessary

- **If none of the conditions exist**

2. Reconnect all previously disconnected EVAP hardware.

NOTE: Refer to the GE 41413-A operation manual for detailed instructions in Evaporative Emission Control System Diagnosis.

3. Remove the fuel fill cap and connect the CH 41415-30 to the fuel tank filler neck. Connect the GE 41413-A to the CH 41415-30 .

4. Command the EVAP Test function with a scan tool to seal the EVAP system.

5. Turn the nitrogen/smoke valve on the GE 41413-A to nitrogen.

NOTE: DO NOT exceed the specified value in this step. Exceeding the specified value may produce incorrect test results.

6. Use the remote switch to activate the GE 41413-A and pressurize the fuel tank to 5.0 in H₂O (1.24 kPa).

7. Verify the scan tool Fuel Tank Pressure Sensor parameter is 0 in H₂O (0 kPa) when commanding the EVAP Vent Solenoid Valve to ON.

- **If not 0 in H₂O**

Test for a blockage or a restriction in the EVAP vent hose or inlet. If the inlet or hose test normal, replace the Q13 Evaporative Emission Vent Solenoid Valve.

- **If 0 in H₂O**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

- **If the DTC sets**

Refer to step 1 above.

- **If the DTC does not set**

9. All OK.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.
2. Test for 25.0-30.0 Ω between the control terminal 1 and the B+ voltage terminal 2.

- **If not within the specified range**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If within the specified range**

3. Verify there is no air flow through the Q13 Evaporative Emission Vent Solenoid Valve by applying vacuum to the pump side of the valve. It should hold 1-2 in. Hg (3-7 kPa) for 30 s.

- **If not within the specified range**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If within the specified range**

4. Reconnect the harness connector at the Q13 Evaporative Emission Vent Solenoid Valve.
5. Command the Q13 Evaporative Emission Vent Solenoid Valve ON with a scan tool.
6. Apply vacuum to the pump side of the valve. It should not hold vacuum

- **If not within the specified range**

Replace the Q13 Evaporative Emission Vent Solenoid Valve

- **If within the specified range**

7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Evaporative Emission Canister Vent Solenoid Valve Replacement**
- Refer to **Control Module References** for ECM replacement, setup, and programming

DTC P2450: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP SWITCHING VALVE PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC P2450

Evaporative Emission (EVAP) System Leak Detection Pump Switching Valve Performance

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of the following components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

When the EVAP leak detection vacuum pump is ON, and the EVAP leak detection pump switching valve transitions from vent to not venting, pump, position, there should be an initial vacuum drop followed by a vacuum increase on a good system. The diagnostic looks for a difference relative to the reference vacuum, either an increase or decrease. No vacuum change indicates a problem with the EVAP leak detection pump switching valve and a P2450 is set. The switching valve is integral to the EVAP leak detection pump assembly and is non serviceable.

Conditions for Running the DTC

- DTCs P043E, P043F, P0451, P1458, P145C, P145D, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P012B, P012C, P012D, P0222, P0223, P0449, P0452, P0453, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P1459, P145A, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2537, P2610, U0073, U0074, U0140, U182D and P2422 is not set.
- The purge solenoid valve is closed.
- The vent solenoid valve is closed.
- The vehicle is OFF.
- The refueling request button pressed.
- A service bay test is not active.
- The EVAP leak detection pump switching valve transitions from vent to not venting, pump position.
- The EVAP leak detection vacuum pump is ON.
- The odometer greater than 16 km (10 mi).
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The engine coolant temperature is less than 40°C (104°F).
- The intake air temperature is between 4 - 45°C (39 - 113°F).
- The system voltage is greater than 10 V.
- The vehicle speed less than 4.8 km/h (3 MPH).
- There are three possible time windows for this test to run. Up to that point, and through this time period, the propulsion system must not be active. These time windows are: 5.0, 8.0 or 11.0 h.

Conditions for Setting the DTC

The EVAP leak detection pump is commanded ON, and the EVAP leak detection pump switching valve transitions from vent to not venting, pump, position. If all conditions are not met after 5 s, then the EVAP leak detection pump switching valve is stuck and the P2450 sets.

Action Taken When the DTC Sets

DTC P2450 is a Type B DTC.

Conditions for Clearing the DTC

DTC P2450 is a Type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.

2. Verify the scan tool EVAP Leak Detection Pump Switching Valve parameter does not display Malfunction when commanded to Venting or Not Venting.

- **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

NOTE: Ensure that the vehicle underbody temperature is similar to the ambient temperature and allow the surrounding air to stabilize before starting the diagnostic procedure.

1. Vehicle in Service Mode.
2. Verify the following scan tool parameters when commanding the EVAP Test ON.
 - The EVAP Leak Detection Pump Command should show ON.
 - The EVAP Leak Detection Pump Switching Valve Command should change from Venting to Not Venting.
 - **If not within specified range**

Replace the Q63 Evaporative Emission System Leak Detection Pump Assembly
 - **If within specified range**
3. Verify and record the EVAP leak detection pump pressure and fuel tank pressure. Both pressures should drop
 - **If status changes, but no pressure drop**
4. Remove the vent pipe and the fresh air pipe from the EVAP leak detection pump assembly
5. Verify the pump openings for any of the conditions listed below
 - The EVAP leak detection pump to the vent solenoid tube and clamps for damage or restriction
 - Missing or damaged EVAP leak detection pump O-rings
 - The fresh air tube near the fuel fill pocket for a restriction
 - The fresh air tube for a restriction

Repair or replace any of the above components.

- If all components test normal

Replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Evaporative Emission System Vacuum Leak Detection Pump Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P2457: EXHAUST GAS RECIRCULATION (EGR) COOLER LOW EFFICIENCY

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2457

Exhaust Gas Recirculation (EGR) Cooler Low Efficiency

Circuit/System Description

The exhaust gas recirculation (EGR) cooler has internal coolant passages and metal fins between the passages to help carry away excessive exhaust gas heat. Engine coolant flowing through the EGR cooler helps cool the exhaust gases flowing to the EGR valve. The EGR cooler must remain within a specific temperature range to efficiently reduce emissions. The engine control module (ECM) determines the efficiency of the EGR cooler by monitoring both EGR temperature sensors while the EGR valve is active.

Conditions for Running the DTC

- DTC P0117, P0118, P011B, P01F0, P0128, P0403, P040C, P040D, P040F, P041C, P041D, P046C, P245A, P245B, P245C, P24A5, or P2228 is not set.
- Battery voltage is greater than 11 V.
- Engine speed is between 1,000 - 4,000 RPM.
- Ambient temperature is greater than -7°C (19°F).
- Up stream exhaust gas temperature is between 200 - 370°C (392 - 698°F).
- Barometric pressure (BARO) is greater than 70 kPa (10 psi).
- DTC P2457 runs continuously when the above conditions are met for at least 80 s.

Conditions for Setting the DTC

The ECM detects that the ratio of the downstream EGR cooler temperature and the upstream EGR cooler temperature is not within a calibrated range.

Action Taken When the DTC Sets

DTC P2457 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P2457 is a Type B DTC.

DTC P24B9-P24BB: EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP PRESSURE SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

DTC Descriptors

DTC P24B9

Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Performance

DTC P24BA

Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Circuit Low Voltage

DTC P24BB

Evaporative Emission (EVAP) System Leak Detection Pump Pressure Sensor Circuit High Voltage

Circuit/System Description

The evaporative emission (EVAP) system uses a EVAP leak detection pump to test for system leaks. The EVAP leak detection pump assembly consists of three main components:

- EVAP leak detection pump with reference orifice
- EVAP leak detection pump switching valve
- EVAP leak detection pump pressure sensor

The EVAP leak detection pump pressure sensor performs a correlation to barometric pressure (BARO). After a short delay period, the EVAP leak detection pump pressure sensor, absolute, reading is compared to the BARO. Large deviations will increment the fail counter threshold and sets a P24B9.

There are two different threshold calibrations used in the comparison to the BARO. A smaller threshold is used

when there has been a recent BARO update and then a larger threshold value is used when there has not been a recent BARO update.

Conditions for Running the DTC

P24B9 - Condition 1:

- DTCs P043E, P043F, P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0116, P0117, P0118, P0119, P0121, P0122, P0123, P0128, P24BB, P145C, P145D, P145E, P145F, P012B, P012C, P012D, P0222, P0223, P0443, P0449, P0451, P0452, P0453, P0458, P0459, P0461, P0462, P0463, P0498, P0499, P0502, P0503, P06E4, P0722, P0723, P1221, P24B9, P24BA, P2066, P2067, P2068, P2400, P2401, P2402, P2418, P2419, P2420, P2421, P2422, P2450, P2537, P2610, U0073, U0074, U0140, U182D is not set.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The fuel level is between 10 - 90%.
- The propulsion system is not active.
- The engine coolant temperature (ECT) is less than 40°C (104°F).
- The intake air temperature (IAT) is between 4 - 45°C (39 - 113°F).
- The battery voltage is greater than 10 V.
- Vehicle speed is less than 1.6 km/h (1 MPH).
- No Vehicle ON during this test.
- No refueling request button is pressed.
- A service bay test is not active.
- The device control exceeds 0.5 s
- There are three possible time windows for this test to run. Up to that point and through this time period the propulsion system must not be active. These time windows are: 5.0, 7.0 or 9.5 h.

P24B9 - Condition 2:

- DTCs P0068, P0071, P0072, P0073, P0101, P0102, P0103, P0106, P0107, P0108, P010C, P010D, P0111, P0112, P0113, P0114, P0121, P0122, P0123, P012B, P012C, P012D, P0222, P0223, P0442, P0443, P0449, P0452, P0453, P0455, P0458, P0459, P0498, P0499, P0502, P0503, P0606, P0722, P0723, P16F3, P1104, P1221, P24B9, P24BA, P24BB, P145D, P145E, P2100, P2101, P2102, P2103, P2400, P2401, P2402, P2418, P2419, P2420, P2422, P2450 is not set.
- The barometric pressure (BARO) is between 70 - 110 kPa (10 - 16 PSI).
- The outside air temperature is between 4 - 35°C (39 - 102°F).
- The propulsion system is active and the engine is running.
- The system voltage is greater than 11 V.
- The purge is not enabled.
- A refueling request button is not pressed.
- The device control exceeds 0.5 s.
- The fuel tank pressure sensor performance diagnostic P0451 is running.
- The EVAP system no purge flow diagnostic P0497 is running.

P24BA and P24BB

Runs any time the engine control module (ECM) is awake and the propulsion system is active or not active.

Conditions for Setting the DTC

P24B9

- When the propulsion system is not active - If the difference between the EVAP system leak detection pump pressure sensor, absolute reading and the BARO value is 3 kPa (0.44 PSI) for 14 s.
- When the propulsion system is active, and after a stabilization time of 10 s - When a recent BARO update has occurred within the last 0.1 km (0.06 mi), if the difference between the EVAP system leak detection pump pressure sensor, absolute, reading and the BARO value from the MAP sensor is 15 kPa (2.17 PSI).
- When a recent BARO update has not occurred within the last 0.1 km (0.06 mi) - If the difference between the EVAP system leak detection pump pressure sensor, absolute, reading and the BARO value from the MAP sensor is 20 kPa (2.9 PSI).

P24BA

The ECM detects that the EVAP system leak detection pump pressure sensor signal is less than 0.7 V for greater than 8 s.

P24BB

The ECM detects that the EVAP system leak detection pump pressure sensor signal is greater than 4.85 V for greater than 8 s.

Action Taken When the DTC Sets

DTCs P24B9, P24BA and P24BB are Type B DTCs.

Conditions for Clearing the DTC

DTCs P24B9, P24BA and P24BB are Type B DTCs.

Diagnostic Aids

- A normal BARO reading of the vehicle's geographic location will help to determine if a BARO sensor is significantly off its reading.
- The diagnostic does not run when purge is enabled because it can influence the EVAP leak detection pump pressure sensor reading if there is any restriction in the fresh air plumbing.
- Test for a plugged 5 micron in-line vent filter between the EVAP system leak detection pump and the fuel fill neck.
- This diagnostic is disabled when P0451 or P0497 is currently running.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the BARO reading against the EVAP leak detection pump sensor reading with a scan tool.
Compare this to the Altitude vs. Barometric Pressure Table referenced here **Altitude Versus Barometric Pressure**
 - **A variance of greater than 3 kPa (0.44 PSI)**

Indicates a skewed BARO or EVAP leak detection pump sensor. Refer to: **DTC P2227-P2230**
 - **A variance of less than 3 kPa (0.44 PSI)**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.
 - **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector Q63 Evaporative Emission System Leak Detection Pump Assembly.

NOTE: Test steps 2 - 6 are performed on the ECM side of the harness connector.

2. Vehicle OFF, all systems OFF, disconnect the harness connector at the Q63 Evaporative Emission System Leak Detection Pump Assembly.
3. Test for less than 5 Ω of resistance between the low reference circuit terminal 8 and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 5 Ω**
4. Vehicle in Service Mode.
5. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 6 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If between 4.8 - 5.2 V**
 - 6. Verify the scan tool EVAP Leak Detection Pump Pressure parameter is less than 0.2 V.
 - **If 0.2 V or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode
 2. Test for less than 1 V between the signal circuit terminal 7 and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K20 Engine Control Module.
 - **If less than 0.2 V**

7. Install a 3 A fused jumper wire between the signal circuit terminal 7 and the 5 V reference circuit terminal 6.
8. Verify the scan tool EVAP Leak Detection Pump Pressure parameter is greater than 4.7 V.
 - **If 4.7 V or less**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 7 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit
 - If infinite resistance
 3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If greater than 4.7 V**
9. Remove the EVAP assembly.
10. Verify none of the conditions listed below exist:
 - Poor connections at the X350 or X351 harness connectors
 - Open or shorted 5 V reference circuit
 - Open or shorted sensor signal circuit
 - Open low reference circuit
 - **If a condition exists**

Repair as necessary.
 - **If no conditions exist**
11. Test or replace the Q63 Evaporative Emission System Leak Detection Pump Assembly.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Evaporative Emission System Vacuum Leak Detection Pump Replacement](#)
- Refer to [Control Module References](#) for ECM replacement, programming and setup.

DTC P2618: CRANKSHAFT POSITION SIGNAL OUTPUT CIRCUIT LOW/HIGH VOLTAGE

3. All OK.

DTC P2635: FUEL PUMP FLOW PERFORMANCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P2635

Fuel Pump Flow Performance

Circuit/System Description

The engine control module (ECM) supplies voltage to the fuel pump driver control module when the ECM detects that the ignition is on. The voltage from the ECM to the fuel pump driver control module remains active for 2 seconds, unless the engine is in crank or run. While this voltage is being received, the fuel pump driver control module closes the ground switch of the fuel pump. The fuel pump driver control module maintains correct fuel pressure based on the information from the fuel pressure sensor and varying the pulse width modulated controlled current to the fuel pump.

Conditions for Running the DTC

- DTC P018B, P018C, P018D, P0231, P0232, P023F, P0641, or P1255 are not active.
- Fuel pump control is enabled and the fuel pump control state is normal.
- The ignition voltage is between 11 - 32 V.
- The engine has been running for greater than or equal to 30 seconds.
- The engine fuel flow is not 0.
- Low fuel level warning not present.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

The fuel pump driver control module detects a difference of $\hat{\pm} 60$ kPa at 400 kPa request or $\hat{\pm} 45$ kPa at 300 kPa request between the desired fuel pressure and the actual fuel pressure for approximately 10 s.

Action Taken When the DTC Sets

DTC P2635 is a Type B DTC.

Conditions for Clearing the DTC

DTC P2635 is a Type B DTC.

Diagnostic Aids

Using the Failure Records data may help locate an intermittent condition. If you cannot duplicate the DTC, the information in the Failure Records can help determine how many miles since the DTC set. The Fail Counter and Pass Counter can help determine how many ignition cycles that the diagnostic test reported a pass and/or a fail.

On vehicles equipped with a high pressure mechanical pump on Direct Fuel Injection engines, the vehicle may continue to run even though the pump in the fuel tank is not operating.

- **If the DTC does not set**

11. All OK.

Circuit/System Testing

NOTE: Do not replace the fuel pump driver control module based on a history DTC P2635. DTC P2635 may be stored but that does not indicate a failure of the fuel pump driver control module. Refer to [Strategy Based Diagnosis](#) for further history DTC diagnostics.

1. Verify the proper fuel system pressure. Refer to [Fuel System Diagnosis](#).

- **If the fuel pressure is not normal**

Repair the fuel system as necessary.

- **If the fuel pressure is normal**

2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Fuel Feed Pipe Replacement**
- Refer to **Fuel Feed Intermediate Pipe Replacement**
- Refer to **Fuel Injector Replacement**
- Refer to **Fuel Pump Fuel Feed Hose Replacement**
- Refer to **Fuel Tank Fuel Pump Module Replacement**
- Perform the Fuel Pump Trim Reset procedure with a scan tool after the repair.

Repair Verification

1. Install any components that have been removed or replaced during diagnosis.
2. Perform any adjustments, programming or setup procedures that are required when a component is removed or replaced.
3. Clear the DTCs with a scan tool.
4. Turn OFF the ignition for 60 s.
5. Operate the vehicle within the Conditions for Running the DTC.
6. Verify the scan tool Short Term Fuel Pump Trim and the Long Term Fuel Pump Trim when multiplied together are less than 1.5.

- **If greater than 1.5**

Refer to Circuit/System Testing.

- **If less than 1.5**

7. Command the Fuel Pressure to 300 kPa (43.5 psi) using the scan tool Control Function: Fuel Pressure Increase/Decrease.
8. Verify the scan tool parameter: Fuel Pressure Sensor & Desired Fuel Pressure are within 45 kPa (6.5 psi) of each other at 300 kPa (43.5 psi) request.

- **If greater than 45 kPa (6.5 psi)**

Refer to Circuit/System Testing.

- **If less than 45 kPa (6.5 psi)**

9. Command the Fuel Pressure to 400 kPa (58 psi) using the scan tool Control Function: Fuel Pressure Increase/Decrease.
10. Verify the scan tool parameter: Fuel Pressure Sensor & Desired Fuel Pressure are within 60 kPa (8.7 psi) of each other at 400 kPa (58 psi) request.
 - **If greater than 60 kPa (8.7 psi)**

Refer to Circuit/System Testing.

- **If less than 60 kPa (8.7 psi)**

11. All OK.

SYMPTOMS - ENGINE CONTROLS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Symptoms Description

Symptoms cover conditions that are not covered by DTCs. Certain conditions can cause multiple symptoms. These conditions are listed together under Symptoms Testing. Conditions that may only cause specific symptoms are listed separately under Additional Symptoms Tests.

However, symptoms which affect the internal combustion engine (ICE) of a typical gas powered vehicle may not be noticeable on the Volt ICE. For the Volt ICE, symptoms such as, hesitation, sag, stumble, sluggishness, surging, and even engine stalling, are buffered by the Voltec propulsion system, which is designed to smooth out ICE irregularities. Even when the battery pack is depleted and the ICE is forced to run in order to sustain the charge, the battery pack should still have enough retained power to perform this buffering function. Refer to [Hybrid Modes of Operation Description](#) for more information.

Perform the symptoms testing before using the additional symptoms testing.

Symptoms Definition

Backfire

Fuel ignites in the intake manifold or in the exhaust system, making a loud popping noise.

Cuts Out, Misses

A steady pulsation or jerking that follows engine speed. The exhaust has a steady spitting sound.

Detonation/Spark Knock

A mild to severe ping which usually gets worse while under load. The engine makes sharp metallic knocks that change with throttle opening.

Dieseling, Run-On

The engine continues to run after the vehicle is turned OFF.

Engine Control Module (ECM) Commanded Reduced Engine Power

The ECM illuminates the Reduced Engine Power lamp and will limit engine power under potential engine damaging or emissions related conditions. A DTC may be not be set.

Fuel Odor

A noticeable smell of unburned fuel.

Hard Start

Engine does not start for a long time. The engine does eventually run, or may start but immediately stall.

Poor Fuel Economy

Fuel economy, as measured by an actual road test, is noticeably lower than expected. Also, the fuel economy is noticeably lower than it was on this vehicle at one time, as previously shown by an actual road test.

Rough, Unstable Idle and/or Stalling

The engine runs unevenly. If severe, the engine or the vehicle may shake and the engine may stall.

Symptoms Verification

Before using the Symptom tables, perform the following inspections

- Verify the engine control module (ECM) and the malfunction indicator lamp (MIL) are operating correctly.
- Verify there are no DTCs stored.
- Verify the scan tool data is within the normal operating range.
- Verify there are no Bulletins available for the current symptom.
- Verify the vehicle tires are correctly inflated and meet original equipment specifications.
- Verify the Hybrid/EV Battery Pack state of charge. A low state of charge will force the engine to idle at a higher RPM. Refer to [Plug-In Charging System Description and Operation](#) .
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help to reveal the cause of an intermittent condition.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movements of a component. Refer to the following for a list of issues that may cause an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Incomplete connector mating
- Poor terminal contact
- High circuit or component resistance - High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harness that is too short or tight
- Wire insulation that is chaffed or cut

- High or low ambient temperature
- High or low engine coolant temperature
- High underhood temperature
- Excessive heat in a component or in a circuit due to circuit resistance, poor terminal contact, or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surfaces
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of aftermarket, add on accessories

Visual/Physical Check

- Verify that the control module grounds are clean, tight, and correctly located.
- Verify that the vacuum hoses are not split or kinked, and are properly routed and connected.
- Verify that the air filter is clean and free from restrictions.
- Verify that there is no water intrusion in connectors, terminals, and components.
- Inspect the air intake ducts for the conditions listed below:
 - Collapsed
 - Damaged areas
 - Looseness
 - Incorrect installation
 - Leaking

If any condition listed above has allowed non-metered air to enter the air induction system, the Q38 THROTTLE BODY: THROTTLE/IDLE LEARN procedure must be performed after the repair is complete.

- Inspect for air leaks at the throttle body mounting area, the mass air flow (MAF) sensor and intake manifold sealing surfaces.
- Inspect the wiring harness for the following conditions:
 - Poor connections
 - Pinches
 - Cuts
- Inspect for loose, damaged, unseated, or missing sensors/components.
- Inspect the terminals for corrosion and correct contact.

Symptoms Testing

Backfire, Cuts-Out, Misses, Detonation/Spark Knock, Dieseling/Run-On, ECM Commanded Reduced Engine Power, Fuel Odor, Hard Start, Poor Fuel Economy, or Rough, Unstable, or Incorrect Idle and Stalling.

- Test/inspect the fuel system for the conditions listed below:
 - Incorrect system operation or fuel pressure. Refer to [Fuel System Diagnosis](#).
 - Contaminated or poor quality fuel. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).
- Test/inspect the ignition system for the conditions listed below:

NOTE: **Observe the scan tool Cylinder 1 - 4 Current Misfire Counters and the Ignition Coil Control Circuit Status parameters to help isolate an ignition system condition.**

- Spark plugs with incorrect heat range, coolant or oil fouling, or an abnormal condition. Refer to [Spark Plug Inspection](#) , and [Spark Plug Replacement](#) .
- Secondary ignition system component susceptible to moisture. Wet down the secondary ignition system with water from a spray bottle. This may help locate damaged or deteriorated ignition system components. Look/listen for arcing or misfiring as the water is applied.
- Weak spark. Use the **J-26792** HEI Spark Tester for testing and refer to [Electronic Ignition System Diagnosis](#). For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\) Special Tools \(Repair Tools\)](#) .
- Test/inspect for the conditions listed below:
 - Non-metered air flow into the air induction system. If a leak is found, repair as necessary. The Q38 THROTTLE BODY: THROTTLE/IDLE LEARN procedure must be performed when the repair is complete.
 - Items that can cause an engine to run lean or rich. Refer to [DTC P0171 or P0172](#) for additional information.
 - An intermittent crankshaft position sensor condition. Observe the scan tool Crankshaft Position Resync Counter parameter. The Resync Counter parameter should remain at 0 during all operating conditions, and when moving the related harnesses and connectors between the crankshaft position sensor and the ECM.
 - Excessive knock sensor system spark retard activity. Observe the scan tool Knock Retard parameter for activity greater than 0° and refer to [DTC P0324, P0326, or P06B6](#) , and [DTC P0325, P0327, or P0328](#) for further diagnosis.
 - Electromagnetic interference on the reference circuit, which can cause a misfire condition. You can usually detect electromagnetic interference with a scan tool by monitoring the engine speed parameter. A sudden increase in the engine speed parameter with little change in actual engine speed may be an indication that electromagnetic interference is present. Inspect the high voltage components near the ignition control circuit if a condition exists.
 - A heated oxygen sensors (HO2S) that is contaminated from fuel, silicon, or from the incorrect use of RTV sealant. The sensors may have a white powdery coating resulting in a high, but false, signal voltage, which gives a rich exhaust indication.
 - A leaking or restricted positive crankcase ventilation system.
- Inspect the exhaust system components for the conditions listed below:
 - Physical damage or possible internal malfunction.
 - Restricted 3-way catalysts.

For additional information, refer to [Symptoms - Engine Exhaust](#)

- Inspect the engine cooling system for the conditions listed below:
 - A thermostat with incorrect heat range. Refer to [Thermostat Diagnosis](#) .
 - Incorrectly operating engine cooling fans. Refer to [DTC P1485-P1487](#) .
 - Incorrectly operating engine coolant thermostat heater. Refer to [DTC P0597-P0599](#) .
 - Low engine coolant level. Refer to [Cooling System Draining and Filling](#) .

For additional information, refer to [Symptoms - Engine Cooling](#) .

- Inspect the engine for the mechanical conditions listed below:
 - Excessive oil in the combustion chamber or leaking valve seals
 - Incorrect cylinder compression
 - Sticking or leaking valves
 - Worn camshaft lobes
 - Incorrect valve timing
 - Broken valve springs
 - Excessive carbon buildup in the combustion chambers. Clean the chambers with Top Engine Cleaner, if necessary. Follow the instructions on the can.
 - Incorrect engine parts

For additional information, refer to [Symptoms - Engine Mechanical](#)

- If the above conditions do not address the symptom, refer to the additional symptoms tests.

Additional Symptoms Tests

Detonation/Spark Knock

- Test the engine for an overheating condition. Refer to [Engine Overheating](#) .
- Inspect for excessive carbon buildup in the combustion chambers. Clean the chambers with Top Engine Cleaner, if necessary. Follow the instructions on the can.

ECM Commanded Reduced Engine Power

Under certain conditions the ECM may limit engine power by reducing engine torque and, for some vehicles, fuel pressure as well. For most, but not all of the conditions, the ECM will illuminate the reduced engine power lamp on the instrument panel cluster, however a DTC may not be set.

A repair may not be necessary. Observe the scan tool Reduced Engine Power History parameter or refer to [K20 Engine Control Module: Scan Tool Information](#) to determine the reason for the reduced engine power.

Verify or inspect for the following:

- Vehicle being driven inappropriately. Towing heavy loads up an incline for an extended period of time or operating the vehicle at sustained, excessively high engine speeds may cause the engine oil or coolant to overheat. Inspect the airflow passageways in front of the engine for obstructions and clear away any debris or foreign material that is found. If no obstructions are found, review approved driving habits with the customer. The customer may need to operate the vehicle at a higher engine speed to improve cooling

system performance, or, at a slower engine speed to reduce engine load.

- If the vehicle is equipped with the OnStar® feature, reduced engine power may be due to OnStar® remote command. Verify the vehicle is not in the OnStar® initiated Stolen Vehicle Slowdown mode.
- A cooling system condition which may cause the engine coolant to overheat. Refer to [Hybrid/EV Cooling System Description and Operation](#) to verify correct operation of the cooling system.
- High pressure fuel system condition. Refer to [Fuel System Diagnosis](#), and [Fuel System Description](#) to verify high pressure fuel system operation.
- Intake air temperature too high. Engine running, observe the scan tool IAT Sensor parameter. The readings should be between -40°C and +149°C (-40°F and +300°F). Refer to [DTC P0112, P0113, or P0114](#) for additional information
- Fuel temperature too high.
- A hybrid/EV propulsion system malfunction. Inspect for the following conditions:
 - Hybrid/EV battery pack charge too low. Review the scan tool Hybrid/EV Battery Pack Charge Remaining parameter for a Battery Power Low condition.
 - Drive motor or inverter temperature too high.
 - Engine powered Hybrid/EV battery charging unavailable. The Internal combustion engine (ICE) may be unable to charge the Hybrid/EV battery. Refer to the conditions listed below for a possible cause:
 - ICE has been run out of fuel. Review the scan tool Remaining Fuel in Tank parameter to verify that the engine has an adequate supply of fuel in the fuel tank.
 - Any ICE performance malfunction, such as an incorrectly operating ignition or fuel system. Review the appropriate scan tool parameters to help diagnose the condition.
 - A Hybrid/EV drive motor 1 (A) or 2 (B) malfunction.
 - An incorrectly operating transmission clutch.
 - An incorrectly operating transmission fluid pump. Inspect for the following conditions:
 - Incorrect transmission fluid level
 - Plugged or restricted transmission fluid coolers or pipes
 - For additional information, refer to [Hybrid Modes of Operation Description](#) .

Fuel Odor

- Inspect for leaking, damaged, or deteriorated fuel lines.
- Inspect for a Saturated EVAP canister. Refer to [Evaporative Emission Control System Description](#) .
- Inspect for a condition with the internal components of the fuel tank assembly. Refer to [Fuel System Description](#) .

Hard Start

- Observe the Throttle Body Idle Airflow Compensation parameter with a scan tool. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and bore and clean, if necessary. Refer to [Throttle Body Inspection and Cleaning](#) .
- Test the engine coolant temperature (ECT) sensor. Compare the ECT sensor value to the intake air temperature (IAT) sensor value on a cold engine. The ECT and IAT sensor values should be within

approximately 3Â°C (5Â°F). If the ECT sensor is out of range with the IAT sensor, test the resistance of the ECT sensor. Refer to [Temperature Versus Resistance \(Engine Coolant Temperature Sensor\)](#) for resistance specifications. Replace the ECT sensor if the resistance is not within specification. If the sensor is within the specification, test the ECT circuits for a high resistance.

- Test the fuel pump operation. The fuel pump should turn ON for 2 s when attempting to start the engine. Refer to [Fuel System Diagnosis](#).

Poor Fuel Economy

- Inspect for heavy loads being carried or towed.
- Observe the Throttle Body Idle Airflow Compensation parameter with a scan tool. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. Inspect the throttle body and bore and clean, if necessary. Refer to [Throttle Body Inspection and Cleaning](#).

Rough, Unstable Idle and/or Stalling

- Engine idle speed may be unstable or the engine may stall if the ECM has learned an incorrect idle/airflow compensation value. A DTC may also set. Observe the scan tool Throttle Body Idle Airflow Compensation parameter. A value greater than 90% may indicate an excessive accumulation of deposits in the throttle bore. If the throttle body needs cleaning, refer to [Throttle Body Inspection and Cleaning](#).

The actions listed below may also cause the ECM to learn an incorrect idle value.

- The engine control module has been replaced
- The throttle body has been replaced
- The throttle body has been cleaned but the idle learn procedure was not performed after completing the cleaning
- The air induction system was leaking, allowing non-metered air to enter the combustion chamber. The leak was repaired but the idle learn procedure was not performed after repairing the leak

If any of the actions listed above have occurred, the Q38 THROTTLE BODY: THROTTLE/IDLE LEARN procedure must be performed.

- Inspect the engine mounts for looseness, wear, and damage.

ENGINE CRANKS BUT DOES NOT RUN

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The engine cranks but does not run is an organized approach to identify a condition which prevents the engine from starting. This diagnostic directs the technician to the appropriate system diagnosis.

Diagnostic Aids

- When the engine is started, it is cranked by the 300 V drive motor/generator, which can rotate the engine to operating speed within just a few hundred milliseconds. However, it may be difficult to determine the running state of the engine. Observe the scan tool ICE Status parameter to determine the running state of the engine. The parameter will display one of the following values:
 - Engine Stalled
 - Invalid
 - OFF
 - Running
 - Silent Start
 - Stop
 - Start
- Some failure conditions can make the engine appear to start, run briefly, then stall, which results in the following two DIC messages being displayed:
 - Engine Not Available, Service Vehicle Soon
 - Propulsion Power Reduced
- Inspect the engine for good secure electrical grounds.
- Insufficient fuel can prevent the engine from starting. Thoroughly inspect the fuel delivery system for sufficient fuel volume to the fuel injectors. Inspect the fuel supply components for partial blockage or restrictions.
- Fuel injectors with partially blocked and restricted nozzles, or a malfunctioning solenoid, can prevent the engine from starting.
- There may be fuel spray at the fuel injectors and the indicated fuel pressure may be correct, yet there may not be enough fuel for combustion to take place. If the fuel injectors and the injector circuit are OK, and fuel spray is detected, the fuel injector ON time may be inadequate. If the engine control module (ECM) receives incorrect inputs from the various information sensors, the fuel delivered by the fuel injectors may be inadequate for the engine to start. Check all the engine data parameters with a scan tool and compare the values indicated with the expected values or the values from a known vehicle in good condition.
- Inspect the engine for good secure electrical grounds.
- Water or foreign material in the fuel can prevent the engine from starting. During freezing weather, the water can freeze inside the fuel system. After 30 min in a heated repair shop, the water may melt and allow the engine to start. The malfunction may not recur until parked overnight in freezing temperatures.
- Under extreme weather conditions, or over a period of time, the ignition system may become susceptible to moisture. This condition may become serious enough to prevent the engine from starting. Bring the vehicle into a dry, heated garage and allow it to dry out for several hours. If the engine then starts, inspect for an ignition system that is susceptible to moisture.

- **J 36012-A** Ignition System Diagnostic Harness

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

NOTE: This diagnostic assumes the following:

- The battery is completely charged. See [Battery Inspection/Test](#) .
- There is adequate fuel in the fuel tank.

1. Attempt to start the engine while observing the DTC information with a scan tool.
2. Verify that DTC P0117, P0118, P018B, P018C, P018D, P0119, P0121, P0122, P0123, P0222, P0223, P0231, P0232, P023F, P025A, P0335, P0336, P0513, P0562, P0563, P0601, P0602, P0603, P0604, P0606, P062F, P0628, P0629, P0633, P0641, P064A, P0685, P0689, P0690, P06A6, P1255, P1516, P1631, P1682, P16F3, P2101, P2119, P2135, P2176, P2610 or P2635 is not set.
 - If any of the DTCs are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - If none of the DTCs are set
3. Verify the scan tool Engine Speed parameter displays greater than 0 RPM while attempting to start the engine.
 - If 0 RPM

Refer to [DTC P0335 or P0336](#) .

- **If greater than 0 RPM**

4. Vehicle in Service Mode, command the Fuel Pump Enable ON several times with a scan tool.
5. Verify the scan tool circuit parameters listed below do not display Malfunction:

- Fuel Pump Enable Circuit High Voltage Test Status
- Fuel Pump Enable Circuit Open Test Status
- Fuel Pump Enable Circuit Low Voltage Test Status
- **If Malfunction is displayed**

Refer to [Fuel System Diagnosis](#).

- **If Malfunction is not displayed**

6. Vehicle OFF, install the CH-48027 digital pressure gauge.

NOTE:

- **If the engine is too hot, high fuel pressure readings may result due to hot soak fuel boiling. Allow the engine coolant temperature to cool to less than 60°C (150°F) before attempting to record fuel pressure.**
- **The fuel pump may need to be commanded ON a few times, in order to obtain the highest possible fuel pressure.**
- **Do NOT start the engine for this test.**

7. Vehicle in Service Mode, command the Fuel Pump Enable ON several times with a scan tool.

Verify the fuel pressure is between 379 - 427 kPa (55 - 62 PSI) with the fuel pump running.

- **If not within the specified range**

Refer to [Fuel System Diagnosis](#).

- **If within the specified range**

8. Vehicle OFF, disconnect the harness connector at a Q17 Fuel Injector.
9. Connect the J 34730-2C injector tester to the fuel injector harness connector.
10. Verify the injector tester flashes or illuminates while attempting to start the engine.

- **If the injector tester does not flash or illuminate**

Refer to [DTC P0201-P0204, P0261, P0262, P0264, P0265, P0267, P0268, P0270, P0271, P1248, P1249, P124A, P124B, P2147, P2148, P2150, P2151, P2153, P2154, P2156, or P2157](#) .

- **If the injector tester flashes or illuminates**

NOTE:

It may be necessary to secure the J 36012-A ignition system diagnostic harness to the spark plug boots with electrical tape.

11. Install the J 36012-A ignition system diagnostic harness to the spark plug boots.
12. Connect the J 26792 HEI spark tester between the boot of a spark plug wire and ground.

13. Connect the remaining wires to the appropriate cylinders.

NOTE:

- Perform the spark test on at least 3 of the 4 cylinders.
- An erratic or weak spark is considered a no spark condition.

14. Verify the spark tester sparks while attempting to start the engine.

- If the spark tester does not spark

Refer to [Electronic Ignition System Diagnosis](#).

- If the spark tester sparks

15. Verify none of the conditions listed below exist:

- Air intake duct to the throttle body collapsed
- Air filter and air intake system restricted/obstructed
- Spark plugs gas or coolant fouled
- Skewed manifold absolute pressure (MAP) sensor
- Skewed engine coolant temperature (ECT) sensor
- Restricted exhaust system. Refer to [Restricted Exhaust](#) .
- Fuel contamination. Refer to [Alcohol/Contaminants-in-Fuel Diagnosis](#).
- Engine mechanical condition, for example, worn timing chain or low compression. Refer to [Symptoms - Engine Mechanical](#) .
- If a condition exists

Repair as necessary.

- If no conditions exist

16. All OK.

Repair Verification

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Ignition Coil Replacement](#)
- Refer to [Spark Plug Replacement](#)

MALFUNCTION INDICATOR LAMP (MIL) DIAGNOSIS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The malfunction indicator lamp (MIL) illuminates to inform the driver that an emission system fault has

occurred and the powertrain control system requires service. Ignition voltage is supplied directly to the MIL. The engine control module (ECM) turns the MIL ON by grounding the MIL control circuit when the emission system fault occurs. Under normal operating conditions, the MIL should be ON only when the vehicle is ON and the engine is OFF.

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Circuit/System Verification

NOTE: Any MIL requesting DTCs that may be set should be diagnosed first.

1. Vehicle Running.
2. Verify the Malfunction Indicator Lamp turns ON and OFF while commanding the Malfunction Indicator Lamp (MIL) On and Off with a scan tool.
 - **If the MIL does not turn ON and OFF**

Refer to Circuit/System Testing.

- **If the MIL turns ON and OFF**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the P16 Instrument Cluster.
2. Vehicle in Service Mode.

3. Verify a test lamp illuminates between the ignition voltage circuit terminal 8 and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ignition voltage circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp does not illuminate and the circuit fuse is open**
 1. Vehicle OFF, disconnect all components on the circuit.
 2. Test for infinite resistance between the ignition voltage circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, test all components connected to the ignition voltage circuit and replace as necessary.
 - **If the test lamp illuminates**
4. Replace the P16 Instrument Cluster.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Control Module References](#) for instrument panel cluster replacement, programming, and setup.

FUEL SYSTEM DIAGNOSIS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) supplies voltage to the fuel pump driver control module when power up is commanded. The voltage signal from the ECM to the fuel pump driver control module remains active for 2 s, unless the vehicle is ON or the vehicle is in Service Mode. While this voltage is being received, the fuel pump driver control module closes the ground switch of the fuel pump and also supplies a varying voltage to the fuel tank fuel pump module in order to maintain the desired fuel line pressure.

The fuel system is an electronic returnless on-demand design. A returnless fuel system reduces the internal temperature of the fuel tank by not returning hot fuel from the engine to the fuel tank. Reducing the internal temperature of the fuel tank results in lower evaporative emissions.

The fuel tank stores the fuel supply. An electric turbine style fuel pump attaches to the fuel tank fuel pump module inside the fuel tank. The fuel pump supplies fuel through the fuel feed pipe to the high pressure fuel pump. The fuel pump also supplies fuel to a venturi pump located on the bottom of the fuel tank fuel pump module. The function of the venturi pump is to fill the fuel tank fuel pump module reservoir. The fuel tank fuel pump module contains a reverse flow check valve. The check valve maintains fuel pressure in the fuel feed pipe in order to prevent long cranking times.

Diagnostic Aids

Observe the Misfire Counters or perform the Fuel Injector Balance Test to help identify a leaking fuel injector.

- [Wiring Repairs](#)

Scan Tool Reference

[Control Module References](#) for scan tool information

Special Tools

- **CH 41769** Fuel Line Quick Disconnect Tool
- **EN 37287** Fuel Line Shut-off Adapter

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

NOTE:

- Repair all fuel system related DTCs, except P2635, before performing this diagnostic.
- Inspect the fuel system for damage or external leaks before proceeding.
- Verify that adequate fuel is in the fuel tank before proceeding.
- The Fuel Pump Enable may need to be commanded ON a few times in order to obtain the highest possible fuel pressure.
- DO NOT perform the Fuel System Diagnosis if the engine coolant temperature is above 60°C (150°F). High fuel pressure readings may result due to hot soak fuel boiling. With the engine OFF, the fuel pressure may increase beyond the pressure relief regulator valve's setting point of 690 kPa (100 psi) ± 5 percent.

1. Vehicle in Service Mode, command the Fuel Pump Enable On and Off several times with a scan tool.
2. Verify that the scan tool Fuel Pressure Sensor parameter is between 345 - 650 kPa (50 - 94 psi).

- **If less than 345 kPa (50 psi)**

Refer to Circuit/System Testing - Fuel Pressure Low.

- **If greater than 650 kPa (94 psi)**

Replace the G12 Fuel Pump.

- **If between 345 - 650 kPa (50 - 94 psi)**

3. Verify that the scan tool Fuel Pressure Sensor parameter, after the fuel pump is turned off, decreases to less than 600 kPa (87 psi).

- **If greater than 600 kPa (87 psi)**

Replace the G12 Fuel Pump.

- **If less than 600 kPa (87 psi)**

4. Verify that the scan tool Fuel Pressure Sensor parameter does not decrease greater than 34 kPa (5 psi) in 1 minute.

- **If greater than 34 kPa (5 psi)**

Refer to Circuit/System Testing - Fuel Pressure Leaks Down.

- **If less than 34 kPa (5 psi)**

5. Engine running.

6. Verify that the scan tool Fuel Pressure Sensor parameter is between 379 - 427 kPa (55 - 62 psi).

- **If less than 379 kPa (55 psi)**

Refer to Circuit/System Testing - Fuel Pressure Low.

- **If greater than 427 kPa (62 psi)**

Replace the G12 Fuel Pump.

- **If between 379 - 427 kPa (55 - 62 psi)**

7. Verify that the scan tool Short Term Fuel Pump Trim and the Long Term Fuel Pump Trim when multiplied together are less than 1.5.

- **If greater than 1.5**

Refer to Circuit/System Testing - Fuel Pressure Low.

- **If less than 1.5**

8. Verify that the scan tool Fuel Pressure Sensor and the Desired Fuel Pressure are within 45 kPa (6.5 psi) at 300 kPa (43.5 psi) request or 60 kPa (8.7 psi) at 400 kPa (58 psi) request of each other while operating the vehicle.

- **If greater than 45 kPa (6.5 psi)/60 kPa (8.7 psi)**

Refer to Circuit/System Testing - Fuel Pressure Drops Off.

- **If less than 45 kPa (6.5 psi)/60 kPa (8.7 psi)**

9. If the fuel system components test normal, refer to [Symptoms - Engine Controls](#), and [Fuel Injector Diagnosis](#).

Circuit/System Testing

Fuel Pressure Low

1. Verify none of the conditions listed below exist:

- Restricted fuel feed pipe
- Inspect the harness connectors and the ground circuits of the fuel pump for poor connections.
- **If a condition exists**

Repair as necessary.

- **If no conditions exist**

Replace the G12 Fuel Pump.

Fuel Pressure Leaks Down

1. Vehicle OFF, relieve the fuel pressure. Refer to [Fuel Pressure Relief](#).
2. Install the **EN 37287** Adapter between the chassis fuel feed hose and the engine compartment fuel feed pipe.
3. Open the valve on the **EN 37287** Adapter.
4. Vehicle in Service Mode, command the Fuel Pump Enable On and then Off with a scan tool.
5. Close the valve on the **EN 37287** Adapter.
6. Verify that the scan tool Fuel Pressure Sensor parameter does not decrease more than 34 kPa (5 psi) in 1 min.

- **If greater than 34 kPa (5 psi)**

Replace the G12 Fuel Pump.

- **If less than 34 kPa (5 psi)**

Locate and replace the leaking Q17 Fuel Injector.

Fuel Pressure Drops Off

1. Verify none of the conditions listed below exist:

- Restricted fuel feed pipe
- Inspect the harness connectors and the ground circuits of the fuel pump for poor connections.
- **If a condition exists**

Repair as necessary.

- **If no conditions exist**

Replace the G12 Fuel Pump.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Feed Pipe Replacement](#)
- Refer to [Fuel Feed Intermediate Pipe Replacement](#)
- Refer to [Fuel Injector Replacement](#)
- Refer to [Fuel Pump Fuel Feed Hose Replacement](#)
- Refer to [Fuel Tank Fuel Pump Module Replacement](#)
- Perform the Fuel Pump Trim Reset procedure with a scan tool after the repair.

FUEL LEAK DIAGNOSIS

Reference Information

Special Tools

- **J-28428-E** High Intensity Black Light Kit
- **J-42220** Leak Detection Lamp

CAUTION: When performing a Fuel Leak Diagnosis, it is VERY IMPORANT to use only GM approved Oil Dye, Part Number 88861206. If any other oil dye is used, it will cause damage to the fuel injection system components, as well as the emission control components. This will result in necessary replacement of the damaged components.

1. Clean all of the fuel lines in the suspected area using brake cleaning solvent, and let dry.
2. Add 8 ounces of oil dye 88861206 to the fuel tank.
3. Start and idle the engine for 3 - 5 minutes.
4. Using a scan tool, increase the Fuel Rail Pressure, if applicable.
5. Verify there are no fuel leaks with **J-28428-E** or **J-42220** around the:

- Fuel pump
- Fuel rails
- Fuel injector supply lines
- Fuel supply lines
- Fuel return lines, if equipped,
- **High pressure or supply side fuel leak is found**

Repair or replace the leaking component

- **If equipped, return side fuel leak is found.**

1. Verify that the fuel return line is not restricted

- If the fuel return line is restricted, repair or replace as necessary
- If the fuel return line is not restricted, repair or replace the leaking component

- **No fuel leak is found**

6. All OK.

FUEL INJECTOR DIAGNOSIS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

The engine control module (ECM) supplies a separate high voltage supply circuit and a high voltage control circuit for each fuel injector. The injector high voltage supply circuit and the high voltage control circuit are both controlled by the ECM. The ECM energizes each fuel injector by grounding the control circuit. The ECM controls each fuel injector with 65 V. This is controlled by a boost capacitor in the ECM. During the 65 V boost phase, the capacitor is discharged through the injector high voltage supply circuit, allowing for initial injector opening. The injector is then held open with 12 V. A fuel injector coil winding resistance that is too high or too low will affect the engine driveability. The fuel injector coil windings are affected by temperature. The resistance of the fuel injector coil windings will increase as the temperature of the fuel injector increases.

Diagnostic Aids

- Monitoring the scan tool Cylinder 1-4 Current Misfire Counters may help to isolate the fuel injector that is causing the condition.
- Operating the vehicle over a wide temperature range may help isolate the fuel injector that is causing the condition.

Fuel Injector Coil Test

NOTE:

- The resistance test must be performed at the fuel injector or mis-diagnosis will occur.
- The DMM and test leads must be calibrated to 0 Ω in order to prevent mis-diagnosis.

1. Vehicle OFF, disconnect the appropriate Q17 Fuel Injector.
2. Test for 1.35 - 1.65 Ω at 20 $^{\circ}\text{C}$ (68 $^{\circ}\text{F}$) between the control + circuit terminal 1 and the control - circuit

terminal 2 at the Q17 Fuel Injector.

- **If not between 1.35 - 1.65 Ω**

Replace the Q17 Fuel Injector.

- **If between 1.35 - 1.65 Ω**

3. Test for infinite resistance between each terminal at the Q17 Fuel Injector and the Q17 Fuel Injector housing/case.

- **If less than infinite resistance**

Replace the Q17 Fuel Injector.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Refer to [Fuel Injector Replacement](#)

FUEL INJECTOR CIRCUIT DIAGNOSIS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Fuel Injector 1 Control +	P2147	P0201	P2148	P1248
Fuel Injector 1 Control -	P0261	P0201	P0262, P2148	P1248
Fuel Injector 2 Control +	P2150	P0202	P2151	P1249
Fuel Injector 2 Control -	P0264	P0202	P0265, P2151	P1249
Fuel Injector 3 Control +	P2153	P0203	P2154	P124A
Fuel Injector 3 Control -	P0267	P0203	P0268, P2154	P124A
Fuel Injector 4 Control +	P2156	P0204	P2157	P124B
Fuel Injector 4 Control -	P0270	P0204	P0271, P2157	P124B

Circuit/System Description

The engine control module (ECM) supplies voltage to each fuel injector on the injector high voltage supply circuits. The ECM energizes each fuel injector by grounding the high voltage control circuit of the fuel injector. The ECM monitors the status of the injector high voltage supply circuits and the injector high voltage control circuits. When a fuel injector circuit condition is detected by the ECM, the affected fuel injector(s) is disabled.

Diagnostic Aids

- Performing the Fuel Injector Diagnosis may help isolate an intermittent condition. Refer to [Fuel Injector Diagnosis](#).
- If the condition is intermittent, move the related harnesses and connectors, with the engine operating, while monitoring the scan tool Injector Control Circuit Status parameters. An Injector Control Circuit Status parameter will change from OK or Not Run to Malfunction if there is a condition with the circuit or a connection.

Circuit/System Verification

NOTE: Do Not perform this procedure unless directed here from the Fuel Injector Balance Test.

1. Vehicle in Service Mode, engine running.
2. Verify the scan tool Cylinder 1 - 4 Current Misfire Counter parameters do not increment.
 - **If the Cylinder 1 - 4 Current Misfire Counters increment**
Refer to Circuit/System Testing.
 - **If the Cylinder 1 - 4 Current Misfire Counters do not increment**
3. Verify the scan tool Cylinder 1 - 4 Injector Control Circuit Status parameters display OK.
 - **If the Cylinder 1 - 4 Injector Control Circuit Status parameters do not display OK**

Refer to Circuit/System Testing.

- **If the Cylinder 1 - 4 Injector Control Circuit Status parameters display OK**

4. All OK.

Circuit/System Testing

1. Vehicle OFF, all vehicle systems OFF, disconnect the X2 harness connector at the K20 Engine Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for infinite resistance between the appropriate Q17 Fuel Injector control + circuit and ground.
 - **If less than infinite resistance**
 1. Disconnect the harness connector of the Q17 Fuel Injector.
 2. Test for infinite resistance between the Q17 Fuel Injector control + circuit and ground.
 - If less than infinite, repair the short to ground in the circuit.
 - If infinite resistance
 3. Test for infinite resistance between the Q17 Fuel Injector control - circuit and ground.
 - If less than infinite, repair the short to ground in the circuit.
 - If infinite, replace the Q17 Fuel Injector.
 - **If infinite resistance**
3. Vehicle in Service Mode.
4. Test for less than 1 V between the Q17 Fuel Injector control + circuit and ground.
 - **If 1 V or greater**
 1. Disconnect the harness connector of the Q17 Fuel Injector, vehicle in Service Mode.
 2. Test for less than 1 V between the Q17 Fuel Injector control + circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, repair the short to voltage on the control - circuit.
 - **If less than 1 V**
5. Vehicle OFF.
6. Test for less than 3 Ω between the Q17 Fuel Injector control + circuit and control - circuit.
 - **If 3 Ω or greater**
 1. Disconnect the harness connector of the Q17 Fuel Injector.
 2. Test for less than 2 Ω on the control + circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω
 3. Test for less than 2 Ω on the control - circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the Q17 Fuel Injector.
 - **If less than 3 Ω**
7. Replace the K20 Engine Control Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- Refer to [Fuel Injector Replacement](#)
- Refer to [Control Module References](#) for K20 Engine Control Module replacement, programming, and setup

ALCOHOL/CONTAMINANTS-IN-FUEL DIAGNOSIS

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Circuit/System Description

Water contamination in the fuel system may cause driveability conditions such as hesitation, stalling, no start, or misfires in one or more cylinders. Water may collect near a single fuel injector at the lowest point in the fuel injection system and cause a misfire in that cylinder. If the fuel system is contaminated with water, inspect the fuel system components for rust or deterioration.

Ethanol concentrations of greater than 10% in non-blended gasoline or greater than 85% with E85 blended gasoline for flexible fuel applications can cause driveability conditions such as hesitation, lack of power, stalling, or no start. Excessive concentrations of ethanol used in vehicles not designed for it may cause fuel system corrosion, deterioration of rubber components, and fuel filter restriction.

Reference Information

Special Tool

CH 44175-A Alcohol Tester Kit, if available

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Circuit/System Verification

1. Remove a sample of fuel from the bottom of the fuel tank and place in a clean, clear container.
2. Place the sample on a level surface for 2 min.
3. Verify the sample is clear and bright in color.
 - **If the sample appears cloudy, or contaminated with water, as indicated by a water layer at the bottom of the sample**

Refer to Circuit/System Testing - Particulate Contaminants in Fuel.

- **If alcohol contamination is suspected**

Refer to Circuit/System Testing - Alcohol in Fuel Testing.

- **If the sample remains clear and bright**

4. All OK.

Alcohol in Fuel Testing with Special Tool, if Available

1. Test the fuel composition using **CH 44175 - A Alcohol Tester Kit and Instruction Manual**.
2. Verify no water appears in the fuel sample.
 - **If water appears in the fuel sample**

Clean the fuel system.
 - **If no water appears in the fuel sample**
3. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample.
4. Verify the non-blended gasoline fuel sample does not measure greater than 15% or an E85 blended gasoline fuel sample measures greater than 91% ethanol.
 - **If greater than the specified value**
 1. Add fresh regular gasoline to the vehicle's fuel tank.
 2. Remove a new sample of fuel from the tank.
 3. Test the fuel composition using **CH 44175 - A Alcohol Tester Kit and Instruction Manual**.
 4. Subtract 50 from the reading on the DMM in order to obtain the percentage of alcohol in the fuel sample.
 5. Verify the non-blended gasoline fuel sample does not measure greater than 15% or an E85 blended gasoline fuel sample measures greater than 91% ethanol.
 - If additional testing indicates that the ethanol percentage is still above 15% for a non-blended gasoline sample, drain and replace the vehicle's fuel. Refer to [Fuel Tank Draining](#) .
 - If additional testing indicates that the E85 blended gasoline sample still measures above 91%, continue adding fresh, regular gasoline until the ethanol content is 85% or less.
 - **If the specified value or less**
5. All OK.

Alcohol in Fuel Testing without Special Tool

NOTE: This procedure is for non-blended gasoline only. If excessive alcohol content is suspected with E85 fuel add 15% tank volume of fresh, regular gasoline to the fuel tank.

1. Using a 100 ml (3.38 oz) specified cylinder with 1 ml (0.034 oz) graduation marks, fill the cylinder with fuel to the 90 ml (3.04 oz) mark.
2. Add 10 ml (0.34 oz) of water in order to bring the total fluid volume to 100 ml (3.38 oz) and install a stopper.
3. Shake the cylinder vigorously for 10 - 15 s.
4. Carefully loosen the stopper in order to release the pressure.
5. Re-install the stopper and shake the cylinder vigorously again for 10 - 15 s.
6. Put the cylinder on a level surface for approximately 5 min in order to allow adequate liquid separation. If alcohol is present in the fuel, the volume of the lower layer, which would now contain both alcohol and

water, will be more than 10 ml (0.34 oz). For example, if the volume of the lower layer is increased to 15 ml (0.51 oz), this indicates at least 5% alcohol in the fuel. The actual amount of alcohol may be somewhat more because this procedure does not extract all of the alcohol from the fuel.

7. Verify the non-blended gasoline fuel sample does not measure greater than 15%.

- **If greater than the specified value**

1. Add fresh regular gasoline to the vehicle's fuel tank.

2. Remove a new sample of fuel from the tank.

3. Test the fuel composition of the new sample.

4. Verify the non-blended gasoline fuel sample does not measure greater than 15%.

- If greater than the specified value, drain and replace the vehicle's fuel. Refer to [Fuel Tank Draining](#).

- If the specified value or less, all OK.

- **If the specified value or less**

8. All OK.

Particulate Contaminants in Fuel

1. Using an approved fuel container, draw approximately 0.5 liter (0.53 qt) of fuel from the bottom of the fuel tank.

2. Place the container on a level surface for approximately 5 min in order to allow settling of the particulate contamination. Particulate contamination will show up in various shapes and colors. Sand will typically be identified by a white or light brown crystals. Rubber will appear as black and irregular particles.

3. Verify there are no physical contaminants or water present in the fuel sample.

- **If any physical contaminants or water are present**

Clean the fuel system.

- **If no physical contaminants or water are present**

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- Refer to [Fuel System Cleaning](#)

- Refer to [Fuel Tank Draining](#)

EVAPORATIVE EMISSION CONTROL SYSTEM DIAGNOSIS

Reference Information

Special Tools

- **EN 41413-VLV** EVAP Service Port Vent Fitting
- **GE 41413-A** Evaporative Emission System Tester (EEST)

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Operating Instructions for the Evaporative Emission System Tester (EEST)

Vehicle Setup

WARNING: In order to reduce the risk of fire and personal injury observe the following items:

- Replace all nylon fuel pipes that are nicked, scratched or damaged during installation, do not attempt to repair the sections of the nylon fuel pipes
- Do not hammer directly on the fuel harness body clips when installing new fuel pipes. Damage to the nylon pipes may result in a fuel leak.
- Always cover nylon vapor pipes with a wet towel before using a torch near them. Also, never expose the vehicle to temperatures higher than 115°C (239°F) for more than one hour, or more than 90°C (194°F) for any extended period.
- Apply a few drops of clean engine oil to the male pipe ends before connecting fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. (During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.)

CAUTION: Use the Evaporative Emission (EVAP) System Tester GE 41413-A in order to provide a clean, dry, low pressure nitrogen gas source. Do not substitute any other pressurized source, gas or otherwise. Damage may result to the EVAP system, test equipment or cause a safety risk.

NOTE: A large difference between the vehicle temperature and shop temperature will seriously affect the accuracy of the tests. Always allow enough time, at least 15 m, for the vehicle temperature to adjust to the shop temperature.

NOTE: If the refueling request button is pushed then the vent solenoid valve will remain open for 30 min. The scan tool will be required to manually close the vent solenoid valve prior to testing and before the 30 min time expires. After 30 min the vent solenoid returns to it's natural closed state.

NOTE: If fuel level is 90% or greater it will take longer to fill the system with smoke because the fuel fill tube check valve will be closed and force any smoke to pass through the Onboard Refueling Vapor Recovery (ORVR) pipe and orifice.

1. Vehicle in Service Mode, open the hood. Position a large fan to blow air under the vehicle onto the fuel tank area.
2. Connect the red battery clip from the tester to the positive battery terminal at the underhood auxiliary fuse

block X50B.

NOTE: The vehicle 12 V battery must be fully charged for optimal tester performance and because every module will be awake in this powered mode.

3. Connect the black battery clip of the tester to chassis ground.

Flow Meter Test - Leak Detection

CAUTION: Clean all of the following areas before performing any disconnections in order to avoid possible contamination in the system:

- The fuel pipe connections
- The hose connections
- The areas surrounding the connections

1. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the front control panel to nitrogen.
2. Connect the hose to the correct test orifice on the bottom front of the tester. For orifice size, refer to the vehicle specific information found in the service procedures for DTCs that relate to EVAP system leaks.
3. Press and release the remote switch to activate the tester.

NOTE: The tester will time out after about 15 min. You may press the remote switch to reactivate the tester as desired.

4. Position the sliding red flag on the flow meter to align with the floating indicator. When the red flag is set, press and release the remote switch to deactivate the tester.
5. Remove the hose from the test orifice and install the hose onto the vehicle. For proper connection location, and the special tool numbers for any adapters that may be required, refer to the service manual for the vehicle being tested. The vehicle specific information can be found in service procedures for DTCs that relate to EVAP system leaks.
6. Seal the EVAP system per instructions in the service manual. Most systems can be sealed using a scan tool output control for the EVAP canister vent solenoid valve. Other systems require that the system be plugged. Refer to the service manual for the vehicle being tested for specific instructions.

NOTE:

- Larger volume fuel tanks, and/or those with lower fuel levels, may require several minutes to fill with nitrogen.
- Static buildup may cause the float indicator to stick. It may be necessary to tap on the flow meter to free the float.

7. Press and release the remote switch to activate the nitrogen flow and fill the system.
8. Compare the stable floating indicator position to the red flag.
 - Below the red flag, the result is acceptable, Pass. Test complete
 - Above the red flag, the result is unacceptable, Fail. Go to the Smoke Procedure
9. Press and release the remote switch to deactivate the tester.

Smoke Procedure - Locate the Leak

NOTE: It is not recommended to use the tester in an outside repair bay area because wind and sunlight may affect temperature and your ability to see the smoke.

1. Turn OFF any fans that may cause air movement around or near the vehicle.

NOTE: Completely unwind the nitrogen/smoke hose from the bracket for optimal tester performance.

2. Connect the nitrogen/smoke hose to the vehicle as directed in the service manual. Some vehicles require that the nitrogen/smoke hose be connected at the front of the EVAP system at the EVAP service port. An adapter may be necessary. Other vehicles require the connection be made at the rear of the system using an adapter at the fuel fill cap. Consult the service manual for vehicle specific instructions regarding connection location and adapters.
3. Open the nitrogen tank valve and turn the nitrogen/smoke valve on the control panel to smoke.

NOTE: The remote switch operates in a push ON, push OFF fashion.

4. Press and release the remote switch to activate the tester and inject smoke into the EVAP system.
5. Verify smoke has filled the EVAP system by opening the system opposite the end where smoke is injected. When injecting smoke at the service port, remove the fuel fill cap and temporarily leave the EVAP canister vent solenoid valve open, and EVAP leak detection pump switching valve in the vent position, until smoke is observed. Then close the system and continue testing. If using a special tool fuel fill cap adapter at the filler neck, use the **EN 41413-VLV** at the service port until smoke is observed, then remove the **EN 41413-VLV** and continue with the test.

NOTE: Inject smoke in less than 2 min cycles for optimal tester performance.

6. Press and release the remote switch to deactivate the tester.

NOTE: For optimal visual smoke performance, deactivate the smoke flow and allow the system pressure to drop. Allowing the smoke to exit through small holes at a low flow rate greatly enhances visibility.

7. Introduce smoke into the system for an additional 60 s. Continue introducing smoke at 15 s intervals, as necessary.
8. Using a high-intensity white light, inspect the entire EVAP system path, and look for the source of the leak indicated by the exiting smoke. Introduce smoke at 15 s intervals, as needed, until the source of the leak is identified.

Temperature Variation Instructions

The Concern

Ideal circumstances for conducting the EVAP flow meter test require equal temperatures between the nitrogen gas and the vehicle EVAP system. Significant differences in temperature between them can result in a flow or pressure change during testing, causing misleading results. Typically, the evaporative emissions system tester is

stored indoors, approximately 21Â°C (70Â°F). Vehicles brought in for diagnosis may have an EVAP system at significantly different temperatures -40 to +43Â°C (-40 to +110Â°F).

For Example

NOTE: With no temperature difference between the nitrogen gas and EVAP system, the resulting vehicle EVAP system pressure will remain stable at 3.2 kPa, 13 in. H₂O, (0.5 PSI) once pressurized, providing no leaks are present.

When the EVAP flow meter tests are performed with significant differences in temperature between the nitrogen gas and the vehicle EVAP system, the following results can occur:

- An increase in flow during the flow meter test can be caused by a vehicle's warm EVAP system cooling down.
- A decrease in flow during the flow meter test can be caused by a vehicle's cool EVAP system warming up.

The Solution

When working on a vehicle with significant differences in temperature between the vehicle EVAP system and the nitrogen gas, allow the vehicle EVAP system temperature to stabilize as close as possible to the temperature of the nitrogen gas before conducting the Flow Meter Test.

INSPECTION/MAINTENANCE SYSTEM CHECK

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Description

Several states require that a vehicle pass on-board diagnostic (OBD) system tests and inspection/maintenance (I/M) emission inspections in order to renew license plates. This is accomplished by viewing the Inspection/Maintenance System Status or Data display on a scan tool. Using a scan tool, the technician can observe the I/M status in order to verify that the vehicle meets the criteria that complies with the local area requirements.

While testing in the I/M System Status mode, some diagnostic trouble codes (DTCs) may occur that are called I/M Test DTCs. An I/M Test DTC is defined as a DTC that is currently commanding the malfunction indicator lamp (MIL) ON, and is stored in non-volatile memory. The intended use of this data is to prevent vehicles from passing I/M inspection without proper repair to the vehicle. These DTCs are not erasable from any scan tool command or by disconnecting power to the controller. I/M Test DTCs are supported by all emissions related electronic control units (ECUs). For example, engine control modules (ECMs), transmission control modules (TCMs), and fuel pump control modules (FPCMs). An I/M Test DTC will not be stored or erased from the control module except at the end of trip processing which occurs 5 s after vehicle OFF.

Conditions for Updating the I/M System Status

NOTE: New vehicles may not report an Inspection/Maintenance System Check pass or fail status for certain post catalyst oxygen sensor or heated oxygen sensor 2 diagnostics prior to 700 miles. After replacing a catalytic converter on a vehicle with greater than 700 miles, it may require up to an additional 700 miles to prevent a false failure status.

Each system requires at least one, and sometimes several, diagnostic tests. The results of these tests are reported by a DTC. A system monitor is complete when either all of the DTCs comprising the monitor have Run and Passed, or any one of the DTCs comprising the monitor have illuminated the MIL. Once all of the tests are completed, the Inspection/Maintenance System Status or Data will indicate YES in the Completed or Value column.

For example, when the HO2S Heater Status indicates YES, either all of the oxygen sensor heater tests have passed or one of the tests has illuminated the MIL. If the vehicle has four heated oxygen sensors, either all four heater circuit tests have passed or one of the heater circuit tests has illuminated the MIL. The Inspection/Maintenance System Status or Data will indicate NO under the Completed or Value column when any of the required tests for that system have not run. The following is a list of conditions that would set the Inspection/Maintenance System Status or Data indicator to NO:

- The vehicle is new from the factory and has not yet been driven through the necessary drive conditions to complete the tests.
- The 12 V battery has been disconnected or discharged below operating voltage.
- The control module power or ground has been interrupted.
- The control module has been reprogrammed.
- The control module DTCs have been cleared as part of a service procedure.

Conditions for Clearing I/M Test DTCs

1. Only the OBD II System can erase I/M Test DTCs. The OBD II system must determine that the malfunction that caused the I/M Test DTC to be stored is no longer present and is not commanding the MIL. Each of the following represents ways to clear an I/M Test DTC:
 - If the MIL goes off due to 3 passing drive cycles, and the scan tool code clear is not used, the I/M Test DTC is erased at power down of the last drive cycle.
 - If a scan tool code clear is used to turn OFF the MIL, the I/M Test DTC is not erased, therefore the DTC must PASS and not FAIL during the drive cycle. The I/M Test DTC is erased at power down of the drive cycle.
 - If the controller is reflashed/reprogrammed, all I/M Test DTCs are erased.
2. For the OBD II System to run a single drive cycle for clearing an I/M Test DTC, all of the following conditions must occur:
 - Vehicle ON, engine run time greater than 600 s.
 - Cumulative vehicle speed is greater than 41 km/h (25 mph) greater than 300 s.
 - Continuous engine running, and vehicle speed is 0 km/h (0 mph) greater than 30 s.
 - Vehicle OFF for 5 s.

Monitored Emission Control Systems

The OBD II system monitors all emission control systems that are on-board, but not all vehicles need every possible emission control system. For example, a vehicle may not be equipped with secondary air injection (AIR) or exhaust gas recirculation (EGR). The OBD II regulations require monitoring of the following; if equipped:

- The air conditioning system
- The catalytic converter efficiency
- Comprehensive component monitoring - Emission related inputs and outputs
- The evaporative emission (EVAP) system
- The fuel delivery system
- Heated catalyst monitoring
- Misfire monitoring
- The oxygen sensor system (O2S or HO2S)
- The oxygen sensor heater system (HO2S heater)

For the specific DTCs required for each system, refer to [Inspection/Maintenance \(I/M\) System DTC Table](#). Systems such as misfire and comprehensive components may not be listed in a system status list. These tests run continuously and do not require an I/M System Status indicator.

Diagnostic Aids

The Inspection/Maintenance System Status or Data display provides an indication of when the control module has completed the required tests. This does not necessarily mean that the test has passed, only that a decision was made. If the diagnostic fails, a DTC will indicate the failure. If a failure indication is present for a DTC associated with one of the I/M regulated systems, it may prevent other required tests from running. For example, a DTC for the control circuit of the EVAP purge solenoid may not be listed in the Inspection/Maintenance System DTC Table because it is a continuous test. If this DTC is set, the Active Tests for the EVAP system may not run.

The Inspection/Maintenance System Status or Data information may be useful for a technician to determine if diagnostics have run when verifying repairs.

Circuit/System Verification

Vehicle in Service Mode, observe the scan tool Inspection/Maintenance System Status or Data indicators, and the I/M Test DTCs. All I/M System Status indicators should display YES, and no I/M Test DTCs should be present.

Circuit/System Testing

NOTE: Many DTC related repairs will instruct the technician to clear the DTC information. Clearing the DTC will reset the Inspection/Maintenance System Status or Data indicators to NO. Performing the I/M Complete System Set Procedure will set each of the I/M System Status indicators to YES.

1. Observe the Engine DTC information with a scan tool. Verify no I/M DTCs are present.
 - If an I/M DTC is set that would prevent the I/M System Status tests from completing, diagnose that

DTC before continuing. Refer to [Inspection/Maintenance \(I/M\) System DTC Table](#).

2. Review applicable service bulletins for software updates that would prevent the I/M System Status tests from completing.
 - If a control module re-program or other repair is required, perform the [Inspection/Maintenance Complete System Set Procedure](#).
3. Observe the Inspection/Maintenance System Status or Data indicators.
 - If any Inspection/Maintenance System Status or Data indicators report NO, perform the [Inspection/Maintenance Complete System Set Procedure](#).

INSPECTION/MAINTENANCE COMPLETE SYSTEM SET PROCEDURE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- Refer to [Diagnostic Procedure Instructions](#) to provide an overview of each diagnostic category.

Description

The purpose of the Inspection/Maintenance (I/M) complete system set procedure is to satisfy the enable criteria necessary to execute all of the I/M readiness diagnostics and complete the trips for those particular diagnostics. When all I/M monitored diagnostic tests are completed, the I/M System Monitor Indicators are set to YES. Perform the Inspection/Maintenance (I/M) Complete System Set Procedure if any I/M System Monitor indicators are set to NO.

Conditions for Meeting a Cold Start

- Ignition voltage between 10 - 32 V.
- Barometric pressure (BARO) between 10 - 16 psi.
- Engine coolant temperature (ECT) less than 40Â°C (104Â°F).
- Intake air temperature (IAT) between 4 - 45Â°C (39 - 113Â°F).
- Fuel level between 10 and 90%.

Circuit/System Verification

1. Verify that all I/M System Status indicators report YES, and that no I/M Test DTCs are present.
 - **If any I/M Test DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .
 - **If no I/M Test DTCs are set**
2. All OK.

Inspection/Maintenance (I/M) System Set Procedure

WARNING: Refer to [Road Test Warning](#) .

NOTE: Since the internal combustion engine must run in order for the I/M

monitors to execute, it is suggested that the vehicle state of charge be depleted prior to performing the road test.

1. Vehicle ON, accelerate to a speed greater than 40 km/h (25 MPH) with engine speed greater than 1800 RPM.
2. Maintain the vehicle speed and engine speed until the engine reaches normal operating temperatures.
3. Park vehicle and ensure that the vehicle meets the conditions for a cold start listed above.
4. Allow vehicle to sit undisturbed for a minimum of 8 hours.
5. Vehicle in Service Mode, observe the Inspection/Maintenance (I/M) Monitors with a scan tool. All of the I/M System Monitors should display YES.
 - If any of the I/M System Monitors display NO, refer to the [Inspection/Maintenance \(I/M\) System DTC Table](#) for the monitor which did not display YES. The I/M System DTC Table identifies the DTCs associated with each I/M System Monitor.

NOTE: An I/M Test DTC will not be stored or erased from the ECU except at the end of trip processing, which occurs 5 s after Vehicle OFF.

6. Observe the I/M Test DTC information with a scan tool. Verify there are no I/M Test DTCs present.
 - If an I/M Test DTC is set, diagnose the DTC using the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) , and refer to [Inspection/Maintenance System Check](#).
7. Observe the ECM DTC information with a scan tool. Verify no DTCs are present.
 - If a DTC is set, diagnose using the [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) . After repairs, perform the [Inspection/Maintenance Complete System Set Procedure](#) to verify no further DTCs are set.

INSPECTION/MAINTENANCE (I/M) SYSTEM DTC TABLE

System	DTCs Required to Set System Status to YES
If an I/M System Status indicator did NOT update to YES during the Inspection/Maintenance Complete System Set Procedure , review each indicator and reference this table to determine each DTC associated with the I/M System Status Indicator. Each DTC listed below has specific conditions that must be met for the diagnostic to run. Included within the conditions are additional DTCs which, if set, may inhibit the DTCs listed below from running. Reviewing and operating the vehicle within the Conditions for Running for each DTC listed below will allow the I/M System Status Indicators to transition to YES.	
Catalyst	DTC P0420
EVAP	• DTC P043E, P043F, or P145F • DTC P0442 or P0455 • DTC P0451-P0453
Fuel	DTC P219A
Oxygen Sensor	• DTC P0131, P0132, P0137, or P0138 • DTC P0133, P013A, P013B, P013E, P013F, P015A, P015B, P2270, or P2271

System	DTCs Required to Set System Status to YES
Oxygen Sensor Heater	<u>DTC P0030-P0032, P0036-P0038, P0053, P0054, P0135, or P0141</u>
Camshaft Position	<u>DTC P0011 or P0014</u>

ELECTRONIC IGNITION SYSTEM DIAGNOSIS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

Circuit/System Description

This ignition system uses an individual coil for each cylinder. The engine control module (ECM) controls the spark events by transmitting the timing pulses on the ignition control (IC) circuits to the individual ignition coils in firing order sequence.

Diagnostic Aids

- An open/high resistance on the low reference circuit to the ignition coil may cause a misfire.
- An erratic or weak spark is considered a no spark condition.

Circuit/System Testing

NOTE: Do not perform this diagnostic procedure unless you were sent here from a misfire DTC or the Engine Cranks But Does Not Run diagnostic.

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate T8 Ignition Coil. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 1 or A and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 5 Ω**
3. Test for less than 5 Ω between the low reference circuit terminal 2 or B and ground.
 - **If 5 Ω or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 5 Ω**
4. Vehicle in Service Mode.
5. Verify a test lamp illuminates between the ignition circuit terminal 4 or D and ground.
 - **If the test lamp does not illuminate**
 1. Vehicle OFF, remove the test lamp.
 2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.
 - **If the test lamp illuminates**
6. Vehicle OFF, exchange the suspect T8 Ignition Coil with the T8 Ignition Coil of a known functioning cylinder.
7. Engine Running.
8. Verify the scan tool Cylinder 1 - 4 Current Misfire Counter does not increment for the same cylinder that the suspect T8 Ignition Coil was removed from.
 - **If increments**

Replace the K20 Engine Control Module.

- **If does not increment**

9. Test or replace the T8 Ignition Coil.

Component Testing

NOTE: You must perform the Circuit/System Testing before proceeding with Component Testing.

1. Vehicle OFF, connect the **EL 26792** HEI Spark Tester to the appropriate T8 Ignition Coil.
2. Engine Running.
3. Verify the spark output of the T8 Ignition Coil.

- **If no output or the output is weak**

Replace the T8 Ignition Coil

- **If the output is good**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Ignition Coil Replacement**
- Refer to **Control Module References** for engine control module replacement, programming, and setup.

Engine Controls and Fuel - 1.5L (L3A) - Repair Instructions - Volt

REPAIR INSTRUCTIONS

WIRE TO WIRE REPAIR - ENGINE CONTROLS AND FUEL

Special Tools

- **EL-38125-10** Splice Sleeve Crimping Tool (non GMNA)
- **J-38125-5A** Ultra Torch Special Tool
- **J-38125-8** Splice Sleeve Crimping Tool (GMNA)

For equivalent regional tools, refer to [Special Tools](#).

WARNING: In order to reduce the risk of personal injury, loss of high voltage isolation to ground and higher system impedance, do not attempt to repair any HV wiring, connector, or terminal that is damaged. High voltage coaxial type cables are not repairable. Never attempt to repair a coaxial type cable. The entire cable/harness or component must be replaced. In order to maintain system integrity and personal safety, never attempt to repair any high voltage wiring, cables, or terminals. Performing this procedure on high voltage circuits may result in serious injury or death.

NOTE: If the wiring harness internal to the transmission is damaged, the wiring harness must be replaced. The use of splice sleeves in an attempt to repair the internal transmission wires, connectors, or terminals could result in performance issues.

NOTE: Do not splice wires in Door Harness Grommets.

NOTE: The DuraSeal splice sleeves have the following 2 critical features:

- A special heat shrink sleeve environmentally seals the splice. The heat shrink sleeve contains a sealing adhesive inside.
- A cross hatched (knurled) core crimp provides the necessary low resistance contact integrity for these sensitive, low energy circuits.

Use only DuraSeal splice sleeves to form a one-to-one splice on all types of insulation except high voltage and specialty cables. Use DuraSeal splice sleeves where there are special requirements such as moisture sealing. Follow the instructions below in order to splice copper wire using DuraSeal splice sleeves.

Splice Sleeve Selection

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	

Splice Sleeve Color	Crimp Tool Nest Color		Wire Gauge mm ² / (AWG)
	3 Crimp Nests	4 Crimp Nests	
Salmon (Yellow-Pink) 19300089	Red (1) or Red/Green (1)	Red (2)	0.22 - 0.8/(18 - 26)
Blue 19168447	Blue (2)	Blue (3)	1.0 - 2.0/(14 - 16)
Yellow 19168448	Yellow (3)	Yellow (4)	3.0 - 5.0/(10 - 12)

NOTE: You must perform the following procedures in the listed order. Repeat the procedure if any wire strands are damaged. You must obtain a clean strip with all of the wire strands intact.

1. Open the harness by removing any tape:
 - Use a sewing seam ripper, available from sewing supply stores, in order to cut open the harness in order to avoid wire insulation damage.
 - Use the DuraSeal splice sleeves on all types of insulation except Tefzel and coaxial.
 - Do not use the crimp and DuraSeal splice sleeve to form a splice with more than 2 wires coming together.
2. Cut as little wire off the harness as possible. You may need the extra length of wire in order to change the location of a splice.

Adjust splice locations so that each splice is at least 40 mm (1.5 in) away from the other splices, harness branches, or connectors.

3. Strip the insulation:
 - When adding a length of wire to the existing harness, use the same size wire as the original wire.
 - Perform one of the following items in order to find the correct wire size:
 - Find the wire on the schematic and convert to regional wiring gauge size.
 - If you are unsure of the wire size, begin with the largest opening in the wire stripper and work down until achieving a clean strip of the insulation.
 - Strip approximately 5.0 mm (0.20 in) of insulation from each wire to be spliced.
 - Do not nick or cut any of the strands. Inspect the stripped wire for nicks or cut strands.
 - If the wire is damaged, repeat this procedure after removing the damaged section.
4. For high temperature wiring, slide a section of high temperature SCT1 shrink tubing down the length of wire to be spliced. Ensure that the shrink tubing will not interfere with the splice procedure.
5. Select the proper DuraSeal splice sleeve according to the wire size. Refer to the above table at the beginning of the repair procedure for the color coding of the DuraSeal splice sleeves and the crimp tool nests.

Fig. 1: Splice Sleeve Crimping Tool With 4 Crimp Nests

Courtesy of GENERAL MOTORS COMPANY

6. The **EL-38125-10** splice sleeve crimping tool has four crimp nests. The largest crimp nest (4) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (3) is used for crimping 14 and 16 gauge wires. The third largest crimp nest (2) is used for crimping 18 and 20 gauge wires. The smallest crimp nest (1) is used for crimping 22 to 26 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.

Fig. 2: Splice Sleeve Crimping Tool With 3 Crimp Nests
Courtesy of GENERAL MOTORS COMPANY

7. The **J-38125-8** splice sleeve crimping tool has three crimp nests. The largest crimp nest (3) is used for crimping 10 and 12 gauge wires. The second largest crimp nest (2) is used for crimping 14 and 16 gauge wires. The smallest crimp nest (1) is used for crimping 18 to 20 gauge wires. The crimp nests are referenced in the table (farther above) under the crimp tool nest color.
8. Use the splice sleeve crimp tool in order to position the DuraSeal splice sleeve in the proper color nest of the splice sleeve crimp tool. For the four crimp nest tool, use the three largest crimp nests to crimp the splice sleeves. For the three crimp nest tool, use all three crimp nests to crimp the splice sleeves. Use the four and three crimp tool diagrams (above) and the table (farther above) to match the splice sleeve with the correct crimp nest. The crimp tool diagram callout numbers match the numbers in the table (under crimp tool nest color).

Fig. 3: Identifying Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

9. Place the DuraSeal splice sleeve in the nest. Ensure that the crimp falls midway between the end of the barrel and the stop. The sleeve has a stop (3) in the middle of the barrel (2) in order to prevent the wire (1) from going further. Close the hand crimper handles slightly in order to firmly hold the DuraSeal splice sleeve in the proper nest.

Fig. 4: Crimped Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

10. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [**Folded-Over Wire Repair**](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.
11. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Repeat steps 4 and 6 for the opposite end of the splice.

Fig. 5: Crimped Duraseal Splice Sleeve

Courtesy of GENERAL MOTORS COMPANY

12. Using the heat torch, apply heat to the crimped area of the barrel.
13. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Weatherpack™ Wiring Repair

NOTE: Some replacement pigtail connectors may be delivered without the terminated leads installed into the connector. For Weatherpack™ connectors, all terminated leads included in the package should to be installed into the connector. If the connector end view shows that a terminal is not occupied, the extra terminated lead(s) need to be installed and the end(s) sealed using a DuraSeal splice sleeve and taped back into the harness.

1. Insert the wire into the splice sleeve barrel until the wire hits the barrel stop. Refer to [Folded-Over Wire Repair](#) for splicing wires of 0.35 mm or less (22, 24, 26 gauge sizes) and for splicing wires of different gauges.

Fig. 6: Tightly Close Handles Of Crimp Tool

Courtesy of GENERAL MOTORS COMPANY

2. Tightly close the handles of the crimp tool until the crimper handles open when released.

The crimper handles will not open until you apply the proper amount of pressure to the DuraSeal splice sleeve. Holding the DuraSEAL with one hand gently tug on the wire to ensure it is crimped in the DuraSeal.

3. Using the heat torch, apply heat to the crimped area of the barrel.

Fig. 7: Heat To Crimped Area Of Barrel

Courtesy of GENERAL MOTORS COMPANY

4. Start in the middle and gradually move the heat barrel to the open ends of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.

Fig. 8: Taping Extra Terminated Leads Back Into Harness

Courtesy of GENERAL MOTORS COMPANY

5. Tape the extra terminated lead(s) back into the harness.

High Temperature Wiring Repairs

Use the following procedures to perform high temperature wiring repairs:

1. Center the high temperature SCT1 shrink tube over the DuraSeal splice sleeve.
2. Using the heat torch, apply heat to the high temperature heat shrink tubing.
3. Gradually move the heat from the center to the open end of the tubing:
 - The tubing will shrink completely as the heat is moved along the insulation.
 - A small amount of sealant will come out of the end of the tubing when sufficient shrinkage is achieved.
4. Replace any reflective tape and clips that may have been removed during the repair.

CONNECTOR RECONNECTION - ENGINE CONTROLS AND FUEL

Special Tools

EL-35616 Terminal Test Probe Kit

For equivalent regional tools, refer to [Special Tools](#) .

When the condition is not currently present, but is indicated in DTC history, the cause may be intermittent. An intermittent may also be the cause when there is a customer complaint, but the symptom cannot be duplicated. Refer to the Symptom Table of the system that is suspect of causing the condition before trying to locate an intermittent condition.

Most intermittent conditions are caused by faulty electrical connections or wiring. Inspect for the following items:

- Loose, corroded, or painted terminal stud/fastener
- Wiring broken inside the insulation
- Poor connection between the male and female terminal at a connector
- A terminal not seated all the way into the connector body
- Poor terminal to wire connection - Some conditions which fall under this description are poor crimps, poor solder joints, crimping over the wire insulation rather than the wire itself, and corrosion in the wire to terminal contact area, etc.
- Pierced or damaged insulation can allow moisture to enter the wiring causing corrosion. The conductor can corrode inside the insulation, with little visible evidence. Look for swollen and stiff sections of wire in the suspect circuits.
- Wiring which has been pinched, cut, or its insulation rubbed through may cause an intermittent open or short as the bare area touches other wiring or parts of the vehicle.
- Wiring that comes in contact with hot or exhaust components
- Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required, in order to verify the customer concern.
- Refer to [Testing for Electrical Intermittents](#) for test procedures to detect intermittent open, high resistance, short to ground, and short to voltage conditions.
- Refer to [Scan Tool Snapshot Procedure](#) for advanced intermittent diagnosis and Vehicle Data Recorder operation.

Testing for Terminal Fretting

Some intermittent conditions can be caused by wire terminal fretting corrosion. Fretting corrosion is a build-up of insulating, oxidized wear debris that can form when there is a small motion between electrical contacts. The oxidized wear debris can pile up enough at the electrical contact spots that the electrical resistance across the connection increases. Movement between the contacting surfaces as small as 10 to 100 microns can cause fretting. To put this in perspective, a sheet of paper is about 100 microns thick, so fretting motion is small and hard to see. Vibration and thermal expansion/contraction are the main sources that create fretting motion. Since vehicles vibrate and can experience large temperature swings, they are a good source for fretting motion. Tin, copper, nickel, and iron surfaces are all susceptible to fretting corrosion. Fretting corrosion can be difficult to see but it looks like small, dark smudges on the terminals contact surface.

To correct a fretting condition disconnect the suspect connector and add dielectric grease / lubricant (Nyogel

760G or equivalent, meeting GM specification 9986087) to both sides of the connector terminals. Then reconnect the connector and wipe away any excess lubricant. This will correct the additional terminal contact resistance due to the terminal fretting corrosion.

Testing for Proper Terminal Contact

It is important to test terminal contact at the component and any inline connectors before replacing a suspect component. Mating terminals must be inspected to ensure good terminal contact. A poor connection between the male and female terminal at a connector may be the result of contamination or deformation.

Contamination may be caused by the connector halves being improperly connected. A missing or damaged connector seal, damage to the connector itself, or exposing the terminals to moisture and dirt can also cause contamination. Contamination, usually in the underhood or underbody connectors, leads to terminal corrosion, causing an open circuit or intermittently open circuit.

Deformation is caused by probing the mating side of a connector terminal without the proper adapter. Always use the **EL-35616** kit when probing connectors. Other causes of terminal deformation are improperly joining the connector halves, or repeatedly separating and joining the connector halves. Deformation, usually to the female terminal contact tang, can result in poor terminal contact causing an open or intermittently open circuit.

Testing for Proper Terminal Contact in Bussed Electrical Centers

It is very important to use the correct test adapter when testing for proper terminal contact of fuses and relays in a bussed electrical center. Use the **EL-35616** kit to test for proper terminal contact. Failure to use the **EL-35616** kit can result in improper diagnosis of the bussed electrical center.

Follow the procedure below in order to test terminal contact:

1. Separate the connector halves.
2. Visually inspect the connector halves for contamination. Contamination may result in a white or green build-up within the connector body or between terminals. This causes high terminal resistance, intermittent contact, or an open circuit. An underhood or underbody connector that shows signs of contamination should be replaced in its entirety: terminals, seals, and connector body.
3. Using an equivalent male terminal/terminated lead, verify that the retention force is significantly different between a known good terminal and the suspect terminal. Replace the female terminal in question.

Flat Wire Connectors

There are no serviceable parts for flat wire connectors on the harness side or the component side.

Follow the procedure below in order to test terminal contact:

1. Remove the component in question.
2. Visually inspect each side of the connector for signs of contamination. Avoid touching either side of the connector as oil from your skin may be a source of contamination as well.
3. Visually inspect the terminal bearing surfaces of the flat wire circuits for splits, cracks, or other imperfections that could cause poor terminal contact. Visually inspect the component side connector to ensure that all of the terminals are uniform and free of damage or deformation.
4. Insert the appropriate adapter into the flat wire harness connector in order to test the circuit in question.

Control Module/Component Voltage and Grounds

Poor voltage or ground connections can cause widely varying symptoms.

- Test all control module voltage supply circuits. Many vehicles have multiple circuits supplying voltage to a control module. Other components in the system may have separate voltage supply circuits that may also need to be tested. Inspect connections at the module/component connectors, fuses, and any intermediate connections between the voltage source and the module/component. A test lamp or a DMM may indicate that voltage is present, but neither tests the ability of the circuit to carry sufficient current. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Power Distribution Schematics](#) .
- Test all control module ground and system ground circuits. The control module may have multiple ground circuits. Other components in the system may have separate grounds that may also need to be tested. Inspect grounds for clean and tight connections at the grounding point (screw or stud). Inspect the connections at the component and in splice packs, where applicable. Operate the component to test the ability of the circuit to carry sufficient current. Refer to [Circuit Testing](#) , and [Ground Distribution Schematics](#) .

Temperature Sensitivity

- An intermittent condition may occur when a component/connection reaches normal operating temperature. The condition may occur only when the component/connection is cold, or only when the component/connection is hot.
- Freeze Frame, Failure Records, Snapshot, or Vehicle Data Recorder data may help with this type of intermittent condition, where applicable.
- If the intermittent is related to heat, review the data for a relationship with the following:
 - High ambient temperatures
 - Underhood/engine generated heat
 - Circuit generated heat due to a poor connection, or high electrical load
 - Higher than normal load conditions, towing, etc.
- If the intermittent is related to cold, review the data for the following:
 - Low ambient temperatures - In extremely low temperatures, ice may form in a connection or component. Inspect for water intrusion.
 - The condition only occurs on a cold start.
 - The condition goes away when the vehicle warms up.
- Information from the customer may help to determine if the trouble follows a pattern that is temperature related.
- If temperature is suspected of causing an intermittent fault condition, attempt to duplicate the condition. Refer to [Inducing Intermittent Fault Conditions](#) in order to duplicate the conditions required.

Electromagnetic Interference and Electrical Noise

Some electrical components/circuits are sensitive to electromagnetic interference or other types of electrical noise. Inspect for the following conditions:

- A mis-routed harness that is too close to high voltage/high current devices such as secondary ignition

components, motors, generator etc. - These components may induce electrical noise on a circuit that could interfere with normal circuit operation.

- Electrical system interference caused by a malfunctioning relay, or a control module driven solenoid or switch - These conditions can cause a sharp electrical surge. Normally, the condition will occur when the malfunctioning component is operating.
- Installation of non-factory or aftermarket add on accessories such as lights, 2-way radios, amplifiers, electric motors, remote starters, alarm systems, cell phones, etc. - These accessories may create interference in other circuits while operating and the interference would disappear when the accessory is not operating. Refer to [Checking Aftermarket Accessories](#) .
- Test for an open diode across the A/C compressor clutch and for other open diodes. Some relays may contain a clamping diode.
- The generator may be allowing AC noise into the electrical system.

Incorrect Control Module

- There are only a few situations where reprogramming a control module is appropriate:
 - A new service control module is installed.
 - A control module from another vehicle is installed.
 - Revised software/calibration files have been released for this vehicle.

NOTE: **DO NOT re-program the control module with the SAME software/calibration files that are already present in the control module. This is not an effective repair for any type of concern.**

- Verify that the control module contains the correct software/calibration. If incorrect programming is found, reprogram the control module with the most current software/calibration. Refer to [Control Module References](#) for replacement, setup, and programming.

BRAKE PEDAL POSITION SENSOR LEARN

Calibration Criteria

NOTE: **Do not apply the brake pedal during the brake pedal position sensor calibration procedure. Any movement of the brake pedal during this procedure will cause the calibration procedure to fail. If this occurs, the brake pedal position sensor calibration must be repeated.**

Brake pedal position sensor calibration must be performed after the brake pedal position sensor, body control module (BCM), or engine control module (ECM) have been serviced. The calibration procedure will set the brake pedal position sensor home value. This value is used by the BCM and ECM to determine the action of the driver applying the brake system and to provide this information to the vehicle subsystems via serial data.

Calibration Procedure

1. Apply the parking brake.
2. Vehicle in Service Mode, transmission in Park.
3. Clear all DTCs.

4. Perform the scan tool Body Control Module Brake Pedal Position Sensor Learn procedure and follow the on-screen instructions.
5. Verify the scan tool Brake Pedal Position Sensor Learned Released Position parameter displays Yes when Learn is completed.
 - **If Yes is not displayed**

Repeat the procedure.
 - **If Yes is displayed**
6. Perform the scan tool Engine Control Module Brake Pedal Position Sensor Learn procedure and follow the on-screen instructions.
7. Verify the scan tool Brake Pedal Position Fully Released Position Learned parameter displays Yes when Learn is completed.
 - **If Yes is not displayed**

Repeat the procedure.
 - **If Yes is displayed**
8. All OK.

THROTTLE OR IDLE LEARN

Description

The engine control module (ECM) learns the airflow through the throttle body to ensure the correct engine speed. The learned airflow values are stored within the ECM. These values are learned to adjust for production variation and will continuously learn during the life of the vehicle to compensate for reduced airflow due to throttle body coking. Anytime the throttle body airflow rate changes, for example due to cleaning or replacing, the values must be relearned.

An engine that had a heavily coked throttle body that has been cleaned or replaced may take several drive cycles to learn out the coking. To accelerate the process, the scan tool has the ability to reset all learned values back to zero. A new ECM will also have values set to zero.

The engine speed may be unstable or a DTC may set if the learned values do not match the actual airflow.

Conditions for Running the Throttle Learn Procedure

Reset Procedure

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0351, P0352, P0353, P0354, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P1101, P1516, P2101, P2119, P2122, P2123, P2127, P2128, P2135, P2138, or P2176 are not set.
- Vehicle in Service Mode.
- The vehicle speed sensor (VSS) is 0 km/h (0 mph).

Learn Procedure

- DTCs P0101, P0102, P0103, P0106, P0107, P0108, P0116, P0117, P0118, P0121, P0122, P0123, P0128, P0171, P0172, P0201, P0202, P0203, P0204, P0222, P0223, P0300, P0351, P0352, P0353, P0354, P0601, P0604, P0606, P060D, P0641, P0651, P0697, P06A3, P1101, P1516, P2101, P2119, P2122, P2123, P2127, P2128, P2135, P2138, or P2176 are not set.
- The engine speed is between 1, 400 - 4, 000 RPM.
- The manifold absolute pressure (MAP) is greater than 5 kPa.
- The mass air flow (MAF) is greater than 2 g/s.
- The ignition voltage is greater than 10 V.

Throttle Learn

Reset Procedure - Performed after the throttle body is cleaned or replaced

1. Vehicle in Service Mode, perform the Idle Learn Reset with a scan tool.
2. Engine running, monitor the Throttle Body Idle Airflow Compensation parameter with a scan tool. The Throttle Body Idle Airflow Compensation value should equal 0 %.
3. Clear the DTCs and return to the diagnostic that referred you here.

Learn Procedure - Performed after the ECM is programmed or replaced

NOTE: Do NOT perform this procedure if DTCs are set. Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

1. Engine running for 3 minutes.
2. Monitor the Engine Speed with a scan tool.
3. The ECM will start to learn the new idle cells and the Engine Speed should start to decrease.
4. Vehicle OFF for 60 s.
5. Engine running for 3 minutes.
6. After the 3 minute run time the engine speed should be normal.
7. Once the engine speed has returned to normal, clear DTCs and return to the diagnostic that referred you here.

METAL COLLAR QUICK CONNECT FITTING SERVICE

Special Tools

- **CH-41769** Fuel Line Disconnect Tool Set
- **CH-44581** Fuel Line Disconnect Tool

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Removal Procedure

WARNING: Refer to [Diesel/Gasoline Vapors Warning](#) .

1. Relieve the fuel system pressure. Refer to [Fuel Pressure Relief](#).

Fig. 9: View Of Quick-Connect Fitting Retainer
Courtesy of GENERAL MOTORS COMPANY

2. Remove the retainer from the quick-connect fitting.

Fig. 10: Blowing Dirt Out Of Fitting (Metal Collar)

Courtesy of GENERAL MOTORS COMPANY

WARNING: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

3. Blow dirt out of the fitting using compressed air.

Fig. 11: View Of Quick Connect Locking Tabs (Metal Collar)

Courtesy of GENERAL MOTORS COMPANY

4. Depending on the fuel line size and ability to access the fitting, choose the appropriate tool: **CH-41769** fuel line disconnect tool set or **CH-44581** fuel line disconnect tool. Insert the **CH-41769** fuel line disconnect tool set or **CH-44581** fuel line disconnect tool into the female connector, then push inward to release the locking tabs.

Fig. 12: View Of Quick Connect Locking Tabs (Metal Collar)

Courtesy of GENERAL MOTORS COMPANY

5. Pull the connection apart.

CAUTION: If necessary, remove rust or burrs from the fuel pipes with an emery cloth. Use a radial motion with the fuel pipe end in order to prevent damage to the O-ring sealing surface. Use a clean shop towel in order to wipe off the male tube ends. Inspect all the connections for dirt and burrs. Clean or replace the components and assemblies as required.

6. Using a clean shop towel, wipe off the male pipe end.

7. Inspect both ends of the fitting for dirt and burrs.

8. Clean or replace the components as required.

Installation Procedure

Fig. 13: Oiling Male Pipe Ends (Metal Collar)

Courtesy of GENERAL MOTORS COMPANY

WARNING: In order to reduce the risk of fire and personal injury, before connecting fuel pipe fittings, always apply a few drops of clean engine oil to the male pipe ends.

This will ensure proper reconnection and prevent a possible fuel leak.

During normal operation, the O-rings located in the female connector will swell and may prevent proper reconnection if not lubricated.

1. Apply a few drops of clean engine oil to the male pipe end.

Fig. 14: View Of Connectors (Metal Collar)

Courtesy of GENERAL MOTORS COMPANY

2. Push both sides of the quick-connect fitting together to cause the retaining tabs to snap into place.

Fig. 15: Ensuring Connection (Metal Collar) Is Secure

Courtesy of GENERAL MOTORS COMPANY

3. Pull on both sides of the quick-connect fitting to make sure the connection is secure.

Fig. 16: View Of Fuel Pipe Retainer

Courtesy of GENERAL MOTORS COMPANY

4. Install the retainer to the quick-connect fitting.
5. Inspect for leaks using the following procedure:
 1. Turn the ignition ON, with the engine OFF for 2 seconds.
 2. Turn the ignition OFF, for 10 seconds.
 3. Turn the ignition ON, with the engine OFF for 2 seconds.
 4. Turn the ignition OFF.
 5. Inspect for leaks.

PLASTIC COLLAR QUICK CONNECT FITTING SERVICE

Removal Procedure

WARNING: Refer to [Diesel/Gasoline Vapors Warning](#) .

NOTE: If servicing a fuel system, insure the fuel pressure has been relieved.

Fig. 17: Plastic Collar Quick Connect Fitting Service

Courtesy of GENERAL MOTORS COMPANY

NOTE:

There are several types of plastic collar fuel and evaporative emission quick connect fittings used on this vehicle.

- Bartholomew (1)
- Q Release (2)
- Squeeze to Release (3)
- Sliding Retainer (4)
- Global Connect (5)
- TI Loc (6)
- Safe Lock (7)
- Plastic Connector (8)

The following instructions apply to all of these types of plastic collar quick connect fittings except where indicated.

Fig. 18: Blowing Dirt Out Of Fitting (Plastic Collar)

Courtesy of GENERAL MOTORS COMPANY

WARNING: Always apply a few drops of clean engine oil to the male pipe ends before connecting the fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. Always replace O-rings.

1. Using compressed air, blow any dirt out of the quick-connect fitting.

Fig. 19: View Of Quick Connect Fitting Release Tabs (Plastic Collar)

Courtesy of GENERAL MOTORS COMPANY

2. This step applies to Bartholomew style connectors ONLY. Squeeze the plastic quick-connect fitting release tabs.

Fig. 20: Releasing Q Release Style Connectors (Plastic Collar)

Courtesy of GENERAL MOTORS COMPANY

3. This step applies to Q Release style connectors ONLY. Release the fitting by Pushing the tab toward the other side of the slot in the fitting.

Fig. 21: Disengaging Quick Connect Fitting (Plastic Collar)

Courtesy of GENERAL MOTORS COMPANY

4. This step applies to Squeeze to Release style connectors ONLY. Squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

Fig. 22: Pushing In Male Side Of Connector
 Courtesy of GENERAL MOTORS COMPANY

5. This step applies to Squeeze to Release style connectors ONLY. Push in the male side slightly in order to slide the retainer away from the retainers, squeeze where indicated by arrows on both sides of the plastic ring surrounding the quick-connect fitting.

Fig. 23: Variants Of Sliding Retainer Style Connectors
 Courtesy of GENERAL MOTORS COMPANY

NOTE: There are two variants of sliding retainer style connectors shown above, both have the same release and installation procedure.

6. This step applies to Sliding Retainer style connectors ONLY. Release the fitting by pressing on one side of the release tab causing it to push in slightly. If the tab doesn't move try pressing the tab in from the opposite side. The tab will only move in one direction.

Fig. 24: Global Connector Style

Courtesy of GENERAL MOTORS COMPANY

7. This step applies to the Global Connector style only. Push the connector toward the tube in order to release the pressure. Press and hold down the release mechanism, and pull the connector straight out.

Fig. 25: TI Loc style

Courtesy of GENERAL MOTORS COMPANY

8. This step applies to the TI Loc style only. Push the connector toward the tube in order to release the pressure. Release the redundant latch (1) with two fingers or a flat bladed tool. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.

Fig. 26: Safe Lock Style

Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Relieving Fuel Pressure Warning](#) .

9. This step applies to the Safe Lock style only. Push the connector toward the tube in order to release the pressure. Release the second latch (1) with two fingers. Then press and hold down the bottom release mechanism (2) and pull the connector straight out.

Fig. 27: Latch And Connector Straight Out
Courtesy of GENERAL MOTORS COMPANY

10. This step applies to the Plastic Connector style 8, push the connector toward the tube in order to release the pressure. Press the latch (1) inward in order to release the pipe, while pulling the connector (2) straight out.
11. Using a clean shop towel, wipe off the male pipe end.
12. Inspect both ends of the fitting for dirt and burrs.
13. Clean or replace components as necessary.

Installation Procedure

Fig. 28: Lubricating Male Pipe End

Courtesy of GENERAL MOTORS COMPANY

WARNING: Always apply a few drops of clean engine oil to the male pipe ends before connecting the fuel pipe fittings. This will ensure proper reconnection and prevent a possible fuel leak. Always replace O-rings.

1. Apply a few drops of clean engine oil to the male pipe end.

Fig. 29: Connecting Quick-Connect Fittings

Courtesy of GENERAL MOTORS COMPANY

2. Push both sides of the quick-connect fitting together in order to cause the retaining feature to snap into place.

Fig. 30: View Of Quick-Connect Fitting

Courtesy of GENERAL MOTORS COMPANY

3. Pull on both sides of the quick-connect fitting to make sure the connection is secure.

Fig. 31: TI Loc style

Courtesy of GENERAL MOTORS COMPANY

4. Insert the tube in the connector until the retainer snaps in place.
5. Push down on the redundant latch (1) until it is fully engaged and snapped into position.

Fig. 32: Redundant Latch

Courtesy of GENERAL MOTORS COMPANY

6. Insert the tube in the connector until the retainer snaps in place.
7. Push down on the second latch (1) in order to secure the connection.

Fig. 33: Latch And Connector

Courtesy of GENERAL MOTORS COMPANY

8. For the plastic connector type 8, depress the latch (1) while inserting the connector (3) on to the pipe (2).
9. Move the latch (1) upward in order to secure the connection.
10. Inspect for leaks using the following procedure:
 1. Turn the ignition ON, with the engine OFF for 2 seconds.
 2. Turn the ignition OFF, for 10 seconds.
 3. Turn the ignition ON, with the engine OFF for 2 seconds.
 4. Turn the ignition OFF.
 5. Inspect for leaks.

EVAPORATIVE EMISSION SYSTEM CLEANING

Special Tools

GE 41413 Evaporative Pressure and Purge Station

For equivalent regional tools, refer to [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Inspection Procedure

CAUTION: Use the Evaporative Emission (EVAP) System Tester GE 41413-A in order to provide a clean, dry, low pressure nitrogen gas source. Do not substitute any other pressurized source, gas or otherwise. Damage may result to the EVAP system, test equipment or cause a safety risk.

NOTE: Proceed with the following procedure only if referenced by an evaporative emission diagnostic or repair procedure.

1. Turn OFF the ignition.
2. Remove the evaporative canister purge solenoid valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#).
3. Lightly tap the evaporative canister purge valve on a hard surface.
4. Inspect for carbon particles exiting either of the vacuum ports.
 - If no carbon particles were detected, but a blockage was detected during a diagnostic procedure, install the original evaporative canister purge valve. Continue with the cleaning procedure.
 - If carbon particles are found during the inspection procedure, continue with the cleaning procedure.
 - If a diagnostic procedure directed you to replace the evaporative canister purge valve and no carbon particles were detected, replace the evaporative canister purge valve. Return to the published service procedure.

Cleaning Procedure

1. Remove the evaporative canister. Refer to [Evaporative Emission Canister Replacement](#).
2. Turn OFF the main valve on the **GE 41413** purge station.
3. Disconnect the hose from the diagnostic station pressure regulator.
4. Using a section of vacuum hose, connect one end onto the evaporative pressure/purge diagnostic station pressure regulator.
5. Connect the other end of the vacuum hose to the canister side of the purge pipe.
6. Turn ON the main nitrogen cylinder valve and continue to discharge nitrogen for 15 seconds.
7. If the nitrogen does not clear the blockage, replace the purge pipe.
8. Return the evaporative pressure/purge diagnostic station to the stations original condition.
9. Install a new evaporative canister. Refer to [Evaporative Emission Canister Replacement](#).
10. Install a new evaporative canister purge valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#).
11. Return to the diagnostic table that sent you here.

ENGINE CONTROL MODULE REPLACEMENT

Removal Procedure

CAUTION:

- Turn the ignition OFF when installing or removing the control module connectors and disconnecting or reconnecting the power to the control module (battery cable, powertrain control module (PCM)/engine control

module (ECM)/transaxle control module (TCM) pigtail, control module fuse, jumper cables, etc.) in order to prevent internal control module damage.

- Control module damage may result when the metal case contacts battery voltage. DO NOT contact the control module metal case with battery voltage when servicing a control module, using battery booster cables, or when charging the vehicle battery.
- In order to prevent any possible electrostatic discharge damage to the control module, do not touch the connector pins or the soldered components on the circuit board.
- Remove any debris from around the control module connector surfaces before servicing the control module. Inspect the control module connector gaskets when diagnosing or replacing the control module. Ensure that the gaskets are installed correctly. The gaskets prevent contaminant intrusion into the control module.
- The replacement control module must be programmed.

NOTE: It is necessary to record the engine oil life percentage remaining. Use the scan tool to reset the engine oil life remaining back to the original percentage recorded.

1. Prepare the engine control module (ECM) for the replacement. Refer to [Control Module References](#).
2. Using a scan tool, retrieve the percentage of remaining engine oil. Record the remaining life engine oil life.
3. Disconnect [Battery Negative Cable Disconnection and Connection](#)
4. Remove [Front Bumper Fascia Removal and Installation](#)

Fig. 34: ECM Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

CAUTION: In order to prevent any possible electrostatic discharge damage to the ECM, do not touch the connector pins.

5. Disconnect the electrical connectors.(1)

Fig. 35: Engine Control Module And Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

6. Remove Engine Control Module (1) - Unlock the retaining tabs.

Installation Procedure

Fig. 36: Engine Control Module And Retaining Tabs
Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Control Module (1)

Fig. 37: ECM Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

2. Connect the electrical connectors.(1)
3. Install [Front Bumper Fascia Removal and Installation](#)
4. Connect [Battery Negative Cable Disconnection and Connection](#)
5. Program the ECM. [Control Module References](#)

ENGINE CONTROL MODULE BRACKET REPLACEMENT

Removal Procedure

1. Remove [Engine Control Module Replacement](#)

Fig. 38: Engine Control Module Bracket, Wiring Harness And Retainers

Courtesy of GENERAL MOTORS COMPANY

2. Unclip Wiring Harness(1) @Engine Control Module Bracket (2)

Release Retainer (3)

Fig. 39: Engine Control Module Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Remove Nut (2)
4. Remove Engine Control Module Bracket (1)

Installation Procedure

Fig. 40: Engine Control Module Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Control Module Bracket (1)

CAUTION: Fastener Caution

2. Install Nut (2) and tighten 9 N.m (80 lb in).

Fig. 41: Engine Control Module Bracket, Wiring Harness And Retainers
Courtesy of GENERAL MOTORS COMPANY

3. Install Wiring Harness (1) @Engine Control Module Bracket (2)

Tighten Retainer (3)

4. Install **Engine Control Module Replacement**

CRANKSHAFT POSITION VARIATION LEARN

The Crankshaft Position Variation Learn procedure is required when the following service procedures have been performed, regardless of whether DTC P0315 is set:

- An engine replacement.
- A engine control module (ECM) replacement.
- A crankshaft balancer replacement.
- A crankshaft replacement.
- A crankshaft position sensor replacement.
- Any engine repairs which disturb the crankshaft to crankshaft position sensor relationship.

The ECM monitors certain component signals to determine if all the conditions are met to continue with the Crankshaft Position Variation Learn procedure. The scan tool only displays the condition that inhibits the procedure. The scan tool displays the signals of the components listed below:

- Crankshaft position sensors activity: If there is a crankshaft position sensor condition, refer to the applicable DTC set.
- Camshaft position sensor signal activity: If there is a camshaft position sensor signal condition, refer to the applicable DTC set.
- Engine coolant temperature (ECT): If the engine coolant temperature is not warm enough, idle the engine until the engine coolant temperature reaches the correct temperature.

1. Verify no DTCs are set.

- If any DTCs other than P0300 - P0308, or P0315 are set

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- If DTC P0300 - P0308, P0315, or no DTCs are set

NOTE: The Crankshaft Position Variation Learn may have to be repeated up to 5 times before the procedure is successful.

2. Engine Running at normal operating temperature, perform the scan tool Crankshaft Position Variation Learn procedure and follow the on screen instructions.

3. Verify the scan tool displays Test Passed Successfully when completed.

- **If Test Passed Successfully is not displayed**

Verify that none of the conditions listed below exist:

- The ignition switch is in the ON position until there is insufficient system voltage.
- An ECM power disconnect with the ignition ON that may have erased the crankshaft position system variation values and set DTC P0315.
- Interference in the signal circuit of the crankshaft position sensor.
- Debris between the crankshaft position sensor and the reluctor wheel.
- A damaged or misaligned reluctor wheel.
- Worn crankshaft main bearings.
- Excessive crankshaft runout.
- A damaged crankshaft.
- If a condition is exists, repair or replace as necessary.
- If no conditions exist, replace the K20 Engine Control Module.

- **If Test Passed Successfully is displayed**

4. Clear all DTCs.

5. Engine Running.

6. Verify a DTC is not set.

- **If a DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- **If a DTC is not set**

7. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for engine control module replacement, programming, and setup.

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT - WATER OUTLET

Removal Procedure

1. Drain the cooling system. [Cooling System Draining and Filling](#)
2. Remove [Heater Outlet Hose Vapor Vent Hose Replacement](#)
3. Remove Radiator Inlet Hose@Water Outlet [Radiator Inlet Hose Replacement](#)

Fig. 42: Heater Outlet Hose Clamp

Courtesy of GENERAL MOTORS COMPANY

4. Loosen Heater Outlet Hose Clamp (2)
5. Disconnect Heater Outlet Hose (1)

Fig. 43: Engine Coolant Temperature Sensor, Electrical Connector, Retainer And Seal

Courtesy of GENERAL MOTORS COMPANY

6. Disconnect the engine coolant temperature sensor electrical connector.(3)
7. Remove Engine Coolant Temperature Sensor Retainer (4)
8. Remove the engine coolant temperature sensor.(2)

9. Remove and DISCARD the seal.(1)

Installation Procedure

Fig. 44: Engine Coolant Temperature Sensor, Electrical Connector, Retainer And Seal
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW seal.(1)
2. Install the engine coolant temperature sensor.(2)
3. Install Engine Coolant Temperature Sensor Retainer (4)
4. Connect the engine coolant temperature sensor electrical connector.(3)

Fig. 45: Heater Outlet Hose Clamp
Courtesy of GENERAL MOTORS COMPANY

5. Connect Heater Outlet Hose (1)
6. Tighten Heater Outlet Hose Clamp (2)
7. Install Radiator Inlet Hose@Water Outlet [Radiator Inlet Hose Replacement](#)

8. Install [Heater Outlet Hose Vapor Vent Hose Replacement](#)
9. Fill the cooling system. [Cooling System Draining and Filling](#)

MANIFOLD ABSOLUTE PRESSURE SENSOR REPLACEMENT

Removal Procedure

1. Relieve the fuel system pressure. [Fuel Pressure Relief](#)
2. Disconnect [Battery Negative Cable Disconnection and Connection](#)
3. Remove [Air Inlet Grille Panel Replacement](#)
4. Remove [Intake Manifold Cover Replacement](#)
5. Remove [Air Cleaner Outlet Duct Replacement](#)

Fig. 46: Air Cleaner Resonator Bracket, Bolt And Wiring Harness Clip
Courtesy of GENERAL MOTORS COMPANY

6. Unclip Wiring Harness Clip (3)
7. Remove Air Cleaner Resonator Bracket Bolt (1)
8. Remove Air Cleaner Resonator Bracket (2)

Fig. 47: Fuel Feed Front Pipe And Fuel Injection Pump

Courtesy of GENERAL MOTORS COMPANY

9. Disconnect Fuel Feed Front Pipe (2) @Fuel Injection Pump (1)
10. Close all open connections with the EN-6015 plugs.
11. Remove Fuel Feed Front Pipe (2)

Fig. 48: Manifold Absolute Pressure Sensor, Electrical Connector, Bolt And Seal Ring

Courtesy of GENERAL MOTORS COMPANY

12. Disconnect the electrical connector.(1)
13. Remove the manifold absolute pressure sensor bolt.(2)
14. Remove the manifold absolute pressure sensor.(3)
15. Remove the seal ring.(4)

Installation Procedure

Fig. 49: Manifold Absolute Pressure Sensor, Electrical Connector, Bolt And Seal Ring
Courtesy of GENERAL MOTORS COMPANY

1. Install Seal Ring (4)
2. Install Manifold Absolute Pressure Sensor (3)

CAUTION: **Fastener Caution**

3. Install Manifold Absolute Pressure Sensor Bolt (2) and tighten 10 N.m (89 lb in)
4. Connect the electrical connector.(1)

Fig. 50: Fuel Feed Front Pipe And Fuel Injection Pump
Courtesy of GENERAL MOTORS COMPANY

5. Install Fuel Feed Front Pipe (2)
6. Remove all **EN-6015** plugs from the connections.
7. Connect Fuel Feed Front Pipe (2) @Fuel Injection Pump (1)

Fig. 51: Air Cleaner Resonator Bracket, Bolt And Wiring Harness Clip
Courtesy of GENERAL MOTORS COMPANY

8. Install Air Cleaner Resonator Bracket (2)
9. Install Air Cleaner Resonator Bracket Bolt (1) and tighten 9 N.m (80 lb in)
10. Install Wiring Harness Clip (3)
11. Install [Air Inlet Grille Panel Replacement](#)
12. Install [Intake Manifold Cover Replacement](#)
13. Install [Air Cleaner Outlet Duct Replacement](#)
14. Connect the negative battery cable. [Battery Negative Cable Disconnection and Connection](#)

KNOCK SENSOR REPLACEMENT

Fig. 52: Knock Sensor
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Intake Manifold Replacement</u>	
1	Knock Sensor Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 25 N.m (18 lb ft)
2	Knock Sensor Procedure Disconnect the electrical connector.

EXHAUST GAS RECIRCULATION VALVE REPLACEMENT

Removal Procedure

1. Remove **Exhaust Gas Recirculation Cooler Temperature Sensor Replacement - Position 1**
2. Drain the cooling system. **Cooling System Draining and Filling**

Fig. 53: Engine Wiring Harness Bracket, Bolt, Nut And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Remove Engine Wiring Harness Bracket Bolt (1)
4. Remove Engine Wiring Harness Bracket Nut (3)
5. Position aside Engine Wiring Harness Bracket (4) -
6. Disconnect the electrical connector.(2)

Fig. 54: EGR Valve Bolts, Cooling Return Hose, Clamp And EGR Cooler Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Loosen Clamp (6)
8. Disconnect Exhaust Gas Recirculation Valve Cooling Return Hose (5)
9. Remove Exhaust Gas Recirculation Cooler Bolt (4)
10. Exhaust Gas Recirculation Valve Bolt (2, 3)

Fig. 55: Exhaust Gas Recirculation Valve And Gaskets

Courtesy of GENERAL MOTORS COMPANY

11. Remove Exhaust Gas Recirculation Valve (1)
12. Remove Gasket (2, 3)

Installation Procedure

Fig. 56: Exhaust Gas Recirculation Valve And Gaskets

Courtesy of GENERAL MOTORS COMPANY

1. Install Gasket (2, 3)
2. Install Exhaust Gas Recirculation Valve (1)

Fig. 57: EGR Valve Bolts, Cooling Return Hose, Clamp And EGR Cooler Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Install Exhaust Gas Recirculation Valve Bolt (2, 3)
4. Install Exhaust Gas Recirculation Cooler Bolt (4)

CAUTION: Fastener Caution

5. Exhaust Gas Recirculation Valve Bolt (2, 3) - Tighten 10 N.m (89 lb in)
6. Exhaust Gas Recirculation Cooler Bolt (4) - Tighten 10 N.m (89 lb in)
7. Connect Exhaust Gas Recirculation Valve Cooling Return Hose (5)
8. Tighten Clamp (6)

Fig. 58: Engine Wiring Harness Bracket, Bolt, Nut And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

9. Install Engine Wiring Harness Bracket (4)

10. Connect the electrical connector.(2)
11. Install Engine Wiring Harness Bracket Nut (3) and tighten 9 N.m (80 lb in)
12. Install Engine Wiring Harness Bracket Bolt (1) and tighten 9 N.m (80 lb in)
13. Fill the cooling system. Cooling System Draining and Filling
14. Install Exhaust Gas Recirculation Cooler Temperature Sensor Replacement - Position 1

EXHAUST GAS RECIRCULATION COOLER TEMPERATURE SENSOR REPLACEMENT - POSITION 1

Removal Procedure

WARNING: Exhaust Service Warning

1. Disconnect Battery Negative Cable Disconnection and Connection
2. Remove Intake Manifold Cover Replacement

Fig. 59: EGR Cooler Temperature Sensor, Wiring Harness, EGR Cooler, Camshaft Cover Bracket And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connector.(1)
4. Remove Exhaust Gas Recirculation Cooler Temperature Sensor Wiring Harness@Camshaft Cover Bracket (2)
5. Remove Exhaust Gas Recirculation Cooler Temperature Sensor (4) @Exhaust Gas Recirculation Cooler (3)

Installation Procedure

Fig. 60: EGR Cooler Temperature Sensor, Wiring Harness, EGR Cooler, Camshaft Cover Bracket And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

1. Install Exhaust Gas Recirculation Cooler Temperature Sensor (4) and tighten 42 N.m (31 lb ft)
2. Install Exhaust Gas Recirculation Cooler Temperature Sensor Wiring Harness@Camshaft Cover Bracket (2)
3. Connect the electrical connector.(1)
4. Install Intake Manifold Cover Replacement
5. Connect Battery Negative Cable Disconnection and Connection

EXHAUST GAS RECIRCULATION COOLER TEMPERATURE SENSOR REPLACEMENT - POSITION 2

Removal Procedure

WARNING: Exhaust Service Warning

1. Disconnect Battery Negative Cable Disconnection and Connection
2. Remove Intake Manifold Cover Replacement
3. Remove Three-Way Catalytic Converter Replacement

Fig. 61: EGR Cooler Temperature Sensor, EGR Cooler, Wiring Harness Clip And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the electrical connector.(1)
5. Unclip Exhaust Gas Recirculation Cooler Temperature Sensor (2) @Wiring Harness Clip (4)
6. Remove Exhaust Gas Recirculation Cooler Temperature Sensor (2) @Exhaust Gas Recirculation Cooler (3)

Installation Procedure

Fig. 62: EGR Cooler Temperature Sensor, EGR Cooler, Wiring Harness Clip And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

1. Install Exhaust Gas Recirculation Cooler Temperature Sensor (2) and tighten 42 N.m (31 lb ft)

2. Exhaust Gas Recirculation Cooler Temperature Sensor (2) @Wiring Harness Clip (4)
3. Connect the electrical connector.(1)
4. Install [Three-Way Catalytic Converter Replacement](#)
5. Install [Intake Manifold Cover Replacement](#)
6. Connect [Battery Negative Cable Disconnection and Connection](#)

EXHAUST GAS RECIRCULATION COOLER OUTLET PIPE REPLACEMENT

Removal Procedure

1. Remove [Dash Upper Extension Panel Opening Cover Replacement](#)
2. Remove [Air Cleaner Outlet Duct Replacement](#)
3. Remove [Water Outlet Replacement](#)
4. Remove [Three-Way Catalytic Converter Replacement](#)

Fig. 63: EGR Temperature Sensor - Position 2, EGR Cooler And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove the exhaust gas recirculation temperature sensor - position 2 (2).
6. Remove Exhaust Gas Recirculation Cooler Bolt (3) @Exhaust Gas Recirculation Cooler (1)

Courtesy of GENERAL MOTORS COMPANY

1. Clean the intake manifold mating surfaces.(2)
2. Install NEW Throttle Body Gasket (1)

Fig. 86: Throttle Body, Electrical Connector And Bolts

Courtesy of GENERAL MOTORS COMPANY

3. Install Throttle Body (3)

CAUTION: Refer to [Fastener Caution](#) .

4. Install Throttle Body Bolt (1) and tighten 10 N.m (89 lb in)
5. Connect Electrical Connector (2)
6. Install Air Cleaner Outlet Duct [Air Cleaner Outlet Duct Replacement](#)
7. Install Dash Upper Extension Panel Opening Cover [Dash Upper Extension Panel Opening Cover Replacement](#)
8. Enable the high voltage system. [High Voltage Disabling](#)
9. Perform the throttle or idle learn. [Throttle or Idle Learn](#)

THROTTLE BODY INSPECTION AND CLEANING

1. Remove [Throttle Body Assembly Replacement](#)

WARNING: Turn OFF the ignition before inserting fingers into the throttle bore. Unexpected movement of the throttle blade could cause personal injury.

CAUTION: Do not insert any tools into the throttle body bore in order to avoid damage to the throttle valve plate.

NOTE: Open the throttle valve in order to inspect all surfaces.

2. Inspect the throttle body bore and the throttle valve plate for deposits.

CAUTION: Do not use any solvent that contains Methyl Ethyl Ketone (MEK). This solvent may damage fuel system components.

3. Clean the throttle body bore and the throttle valve plate using a clean shop towel with an appropriate cleaner.
4. Install [Throttle Body Assembly Replacement](#).
5. [Throttle or Idle Learn](#)

FUEL PRESSURE RELIEF

WARNING: Fuel that flows out at high pressure can cause serious injury to the skin and eyes. ALWAYS depressurize the fuel system before removing components that are under high fuel pressure.

WARNING: Remove the fuel tank cap and relieve the fuel system pressure before servicing the fuel system in order to reduce the risk of personal injury. After you relieve the fuel system pressure, a small amount of fuel may be released when servicing the fuel lines, the fuel injection pump, or the connections. In order to reduce the risk of personal injury, cover the fuel system components with a shop towel before disconnection. This will catch any fuel that may leak out. Place the towel in an approved container when the disconnection is complete.

Scan Tool Method - Preferred

1. Install a scan tool and turn the ignition ON.
2. Using the scan tool, command the fuel pump OFF allowing the low pressure fuel pump to shut off.
3. Start the vehicle and allow the engine to idle until the engine stops. The engine will stop in approximately 5-20 seconds.
4. Repeat step 3. Using the scan tool, verify pressure has dropped to a minimal level.
5. Turn the ignition OFF.

Alternate Method - If a scan tool is not available

1. Disable the fuel pump by removing the B+ fuel pump control module fuse. Refer to [Electrical Center Identification Views](#).
2. Start the vehicle and allow the engine to idle until the engine stops. The engine will stop in approximately 5-20 seconds.
3. Attempt to restart the vehicle to ensure pressure has dropped to a minimal level.
4. Turn the ignition OFF.

FUEL TANK DRAINING

Special Tool

CH 45004 Fuel Tank Drain Hose

WARNING: Never drain or store fuel in an open container. Always use an approved fuel storage container in order to reduce the chance of fire or explosion.

WARNING: Place a dry chemical (Class B) fire extinguisher nearby before performing any

on-vehicle service procedures. Failure to follow these precautions may result in personal injury.

1. Remove the fuel fill cap.

Fig. 87: Draining Fuel Tank

Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate the fuel drain hose with Transjel Lubricant or equivalent to aid in hose insertion.

2. Insert the **CH 45004** hose into the fuel tank until the bottom is reached.
3. Use a hand or air operated pump device in order to drain as much fuel through the fuel fill pipe as possible.

4. Disconnect Fuel Pump Fuel Feed Hose (2) @Fuel Tank Fuel Pump Module (1) -[Plastic Collar Quick Connect Fitting Service](#)
5. Close all open connections with the **EN-6015** plugs.
6. Unclip Fuel Pump Fuel Feed Hose (2) @Retainer (3)

Installation Procedure

Fig. 143: Fuel Tank Fuel Pump Module, Fuel Pump Fuel Feed Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Install Fuel Pump Fuel Feed Hose (2) @Retainer (3)
2. Remove the **EN-6015** plugs from all connections.
3. Connect Fuel Pump Fuel Feed Hose (2) @Fuel Tank Fuel Pump Module (1) -[Plastic Collar Quick Connect Fitting Service](#)
4. Install [Fuel Tank Replacement](#)
5. Connect [Battery Negative Cable Disconnection and Connection](#)
6. Cycle the ignition to run the fuel pump and check for fuel leaks.

FUEL INJECTION FUEL RAIL ASSEMBLY REPLACEMENT

Special Tools

EN-51146 Fuel Injector Removal / Installation Kit

Equivalent regional tools: [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#) .

Removal Procedure

WARNING: [Diesel/Gasoline Vapors Warning](#)

WARNING: [Safety Goggles and Fuel Warning](#)

CAUTION: When working on the fuel rail and fuel injectors, always maintain a clean work surface. Failure to maintain a clean work surface can result in contaminant on the injector seals and cause leaks.

1. Remove [Fuel Injection Fuel Rail Assembly Removal and Installation](#)

Fig. 144: Plate, Bolts And Supports

Courtesy of GENERAL MOTORS COMPANY

NOTE: The EN-51146 - 2 - 5 calibrations tools must be installed.

2. Remove the 8 plate bolts (1) and remove the **EN-51146-1-2** plate (2), counterhold with a wrench (4) at the **EN-51146-1-1** supports (3).
3. Remove the 8 **EN-51146-1-1** supports (3).

Fig. 145: Fuel Injection Fuel Rail, Fuel Injector And Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect Fuel Injector Wiring Harness (2)
5. Remove Fuel Injector (3) @Fuel Injection Fuel Rail (1)

Fig. 146: Fuel Injector And O-Ring

Courtesy of GENERAL MOTORS COMPANY

6. Remove O-Ring (1) @Fuel Injector (2) and DISCARD

Cleaning Procedure

Clean the fuel injector bores. If the fuel injectors will be reused, clean the fuel injectors. [**Fuel Injection Fuel Rail Assembly Removal and Installation.**](#)

Installation Procedure

Fig. 147: Fuel Injector And O-Ring

Courtesy of GENERAL MOTORS COMPANY

1. Coat the fuel injector seals with engine oil.(1)

NOTE: The EN-51146 - 2 - 5 calibrations tools must be installed.

2. Install O-Ring (1) @Fuel Injector (2)

Fig. 148: Fuel Injection Fuel Rail, Fuel Injector Wiring Harness Connectors, Fuel Injectors And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT reuse the old bolt.

3. Install Fuel Injector (3) @Fuel Injection Fuel Rail (1)

4. Apply thread locking adhesive to the NEW fuel injector bolts.(4)Adhesives, Fluids, Lubricants, and Sealers

CAUTION: Fastener Caution

NOTE: Install NEW bolts.

5. Install Fuel Injector Bolt (4) @Fuel Injector(3) and tighten 5 N.m (44 lb in)

6. Connect Fuel Injector Wiring Harness (2)

7. Install Fuel Injection Fuel Rail Assembly Removal and Installation

FUEL INJECTOR REPLACEMENT

Special Tools

EN-51146 Fuel Injector Removal / Installation Kit

Equivalent regional tools:Special Tools (Diagnostic Tools) Special Tools (Repair Tools) .

Removal Procedure

WARNING: Diesel/Gasoline Vapors Warning

WARNING: Safety Goggles and Fuel Warning

CAUTION: When working on the fuel rail and fuel injectors, always maintain a clean work surface. Failure to maintain a clean work surface can result in contaminant on the injector seals and cause leaks.

1. Remove Fuel Injection Fuel Rail Assembly Removal and Installation

Fig. 149: Plate, Bolts And Supports

Courtesy of GENERAL MOTORS COMPANY

NOTE: The EN-51146 - 2 - 5 calibrations tools must be installed.

2. Remove the 8 plate bolts (1) and remove the EN-51146-1-2 plate (2), counterhold with a wrench (4) at the EN-51146-1-1 supports (3).
3. Remove the 8 EN-51146-1-1 supports (3).

Fig. 150: Fuel Injection Fuel Rail, Fuel Injector And Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect Fuel Injector Wiring Harness (2)
5. Remove Fuel Injector(3)@Fuel Injection Fuel Rail(1)

Fig. 151: Fuel Injector And O-Ring

Courtesy of GENERAL MOTORS COMPANY

6. Remove O-Ring (1) @Fuel Injector (2) and DISCARD

Cleaning Procedure

1. Clean the fuel injector bores. If the fuel injectors will be reused, clean the fuel injectors. [**Fuel Injection Fuel Rail Assembly Removal and Installation.**](#)
2. Inspect the NEW fuel injector. [**Fuel Injection Fuel Rail Assembly Removal and Installation.**](#)

Installation Procedure

Fig. 152: Fuel Injector And O-Ring

Courtesy of GENERAL MOTORS COMPANY

1. Coat the fuel injector seals with engine oil.(1)

NOTE: The EN-51146 - 2 - 5 calibrations tools must be installed.

2. Install O-Ring (1) @ Fuel Injector (2)

Fig. 153: Fuel Injection Fuel Rail, Fuel Injector Wiring Harness Connectors, Fuel Injectors And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do NOT reuse the old bolt.

3. Install Fuel Injector(3) @Fuel Injection Fuel Rail (1)
4. Apply thread locking adhesive to the NEW fuel injector bolts.(4)Adhesives, Fluids, Lubricants, and Sealers

CAUTION: Fastener Caution

NOTE: Install NEW bolts.

5. Install Fuel Injector Bolt (4) @Fuel Injector (3) and tighten 5 N.m (44 lb in)
6. Connect Fuel Injector Wiring Harness(2)
7. Install Fuel Injection Fuel Rail Assembly Removal and Installation

FUEL INJECTOR WIRING HARNESS REPLACEMENT

Removal Procedure

1. Remove Fuel Injection Fuel Rail Assembly Replacement

Fig. 154: Fuel Injector Wiring Harness Components

Courtesy of GENERAL MOTORS COMPANY

2. Cut the cable tie (3).
3. Disconnect the fuel injection fuel rail fuel pressure sensor wiring harness electrical connector (2) from the fuel rail fuel pressure sensor (4).
4. Remove and DISCARD the 4 insulating tape stripes (1, 5).
5. Disconnect the 4 fuel injector wiring harness electrical connectors (9, 11) from the fuel injectors (10).
6. Clip out the fuel injector wiring harness (6) from the fuel rail (7).
7. Cut the 4 cable ties (8, 12).

Installation Procedure

Fig. 155: Fuel Injector Wiring Harness Components

Courtesy of GENERAL MOTORS COMPANY

1. Connect the 4 fuel injector wiring harness electrical connectors (9, 11) to the 4 fuel injectors (10).

2. Clip in the fuel injector wiring harness (6) to the fuel rail (7).
3. Install NEW 4 cable ties (8, 12) to the position where they have been removed.
4. Connect the fuel injection fuel rail fuel pressure sensor wiring harness plug (2) to the fuel rail fuel pressure sensor (4).
5. Install a NEW cable tie (3) to the position where it have been removed.
6. Install 4 NEW insulating tape stripes (1, 5) to the position where it have been removed.
7. Install [Fuel Injection Fuel Rail Assembly Replacement](#)

FUEL INJECTION FUEL RAIL ASSEMBLY REMOVAL AND INSTALLATION

Special Tools

- **EN-51146** Fuel Injector Removal/ Installation Kit
- **EN-51146-100** Adapter Plate
- **EN-51146-150** Injector Remover/Installer Adapters

Equivalent regional tools: [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#)

Removal Procedure

WARNING: The noise cancelling foam component **MUST** be replaced if it has been exposed to engine fluids. Failure to replace the noise cancelling foam component that has been exposed to engine fluids may result in an engine fire resulting in catastrophic engine damage, and possible injury or death.

WARNING: [Diesel/Gasoline Vapors Warning](#)

WARNING: [Safety Goggles and Fuel Warning](#)

CAUTION: When working on the fuel rail and fuel injectors, always maintain a clean work surface. Failure to maintain a clean work surface can result in contaminant on the injector seals and cause leaks.

1. Remove [Ignition Coil Replacement](#)
2. Remove [Fuel Feed Intermediate Pipe Replacement](#)

Fig. 156: Fuel Injection Fuel Rail Wiring Harness And Fuel Rail Bolts
 Courtesy of GENERAL MOTORS COMPANY

3. Disconnect Fuel Injection Fuel Rail Wiring Harness(1)

NOTE: The fuel rail bolts remain with decoupling elements and retainer at the fuel rail assembly.

4. Loosen the 4 fuel rail bolts (2) from the cylinder head completely, but do not remove the bolts.

Fig. 157: fuel injector cylinder 1
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Never loosen both bolts at the same time. Failure to follow this caution could cause leaks or malfunction after installation.

NOTE: Pay attention, that the bolt does not fall into the cylinder head slot.

5. Remove the fuel injector bolt (1) from the fuel injector cylinder 1 (2) at the rail side.

Fig. 158: Demounting Screw And Support

Courtesy of GENERAL MOTORS COMPANY

6. Install the **EN-51146 - 1-150** demounting screw to the **EN-51146-1-1** support (1) and tighten to 7N.m (62 lb in).

Fig. 159: Support And Cylinder 1 Fuel Injector

Courtesy of GENERAL MOTORS COMPANY

7. Install the **EN-51146-1-1** support (1) to the fuel injector cylinder 1 (2) and tighten to 5 N.m (44 lb in).

Fig. 160: Fuel Injector Cylinder

Courtesy of GENERAL MOTORS COMPANY

8. Remove the fuel injector bolt (1) from the fuel injector cylinder 1 (2).
9. Install the **EN-51146-1-6** demounting screw or **EN-51146-150** demounting screw to the **EN-51146-1-1** support and tighten to 7 N.m (62 lb in).

Fig. 161: Support And Cylinder 1 Fuel Injector

Courtesy of GENERAL MOTORS COMPANY

10. Install the **EN-51146-1-1** support (1) to the fuel injector cylinder 1 (2) and tighten to 5 N.m (44 lb in).
11. Repeat the steps 5 - 10 for the other 3 injectors.

Fig. 162: Fuel Rail Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The fuel rail bolts remain with decoupling elements and retainer at the fuel rail assembly.

12. Loosen the 4 fuel rail bolts (1) completely from the cylinder head, but do not remove the bolts.

Fig. 163: Plates, Supports And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Mind the arrow on the EN-51146-100 plate. The arrow must show in driving direction.

13. Install the **EN-51146-100** plate (2) to the 8 **EN-51146-1-1** supports (4).

14. Install the 8 plate bolts (3).

15. Tighten the 8 plate bolts (3) and counterhold with a wrench (1) at the **EN-51146-1-1** supports (4).

Fig. 164: Slide Hammers And Plate

Courtesy of GENERAL MOTORS COMPANY

16. Install the 2 EN-51146-1-3 sliding hammers (1) to the EN-51146-1-2 plate (2).

Fig. 165: Removing Injectors

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the fuel injectors do not become tilted. Failure to follow this caution can tilt or bend the injectors and could cause leaks or malfunction after installation.

17. Use the 2 EN-51146-1-3 sliding hammers at first equally to remove the fuel injector rail assembly, if necessary apply additional force to either side as necessary to release the rail evenly.
18. Ensure that the angle of the 2 EN-51146-1-3 sliding hammers (1) accord to the angle of the fuel injectors (2), while removing.

CAUTION: After removal of the fuel injection fuel rail assembly, check the

completeness of the assembly. Check that no decoupling elements, fuel rail bolts or fuel injector seals remain near the fuel injector bores on the cylinder head. Failure to perform this can result in poor engine performance or engine damage.

19. Remove the fuel injector rail assembly.

Fig. 166: Plate Installed In Vise

Courtesy of GENERAL MOTORS COMPANY

CAUTION: After removing the fuel rail and injector assembly, do not allow the weight of the assembly to rest on the fuel injectors. Always position the assembly on a clean work surface with the fuel injectors on top. Failure to follow this caution could cause leaks or malfunction after installation.

20. Install the **EN-51146-1-2** plate (1) with the fuel injector assembly to a bench vise (2).

Fig. 167: Calibration Tools And Fuel Injectors

Courtesy of GENERAL MOTORS COMPANY

NOTE: The EN-51146-2-5 calibration tools are also used to protect the fuel injectors.

21. Install the 4 EN-51146-2-5 calibration tools (2) rotary to the fuel injectors (1), as shown in the graphic.
22. Cover the fuel injector bores at the cylinder head, to prevent for dirt.
23. Remove the 2 EN-51146-1-3 sliding hammers.
24. Remove the 4 EN-51146-2-5 calibration tools.

Fig. 168: Combustion Seals And Stylus

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Always use the stylus from the EN-51146 fuel injector kit. Never use a metal tool in place of the stylus. Use of another tool can damage the fuel injector and may cause a leak.

25. Remove the 2 combustion seals (2) each fuel injector, use EN-51146-2-1 stylus (1).
26. Inspect all fuel injectors for damage.

Installation Procedure

1. Clean and inspect the fuel injectors and the fuel injector rail. Do not remove the fuel injector from the fuel rail. Refer to [Fuel Injector and Fuel Injector Bore Cleaning and Inspection](#) .

Fig. 169: Combustion Fuel Injector Seal And Long Mounting Sleeve
Courtesy of GENERAL MOTORS COMPANY

2. Install a NEW combustion fuel injector seal (1) to the **EN-51146-2-2** mounting sleeve-long (2).

Fig. 170: Installing Combustion Seals
Courtesy of GENERAL MOTORS COMPANY

3. Use the **EN-51146-2-6-1** slider outside (1) to push down the combustion fuel injector seal (2) on the **EN-51146-2-2** mounting sleeve-long (3).

Fig. 171: Installing Combustion Seals

Courtesy of GENERAL MOTORS COMPANY

4. Push the combustion fuel injector seal (2) over the **EN-51146-2-2** mounting sleeve-long, use the **EN-51146-2-6-1** slider outside (1) to the fuel injector (3).
5. Remove the **EN-51146-2-2** mounting sleeve-long with the **EN-51146-2-1** stylus from the **EN-51146-2-6-1** slider outside.
6. Install a NEW combustion fuel injector seal to the **EN-51146-2-3** mounting sleeve-short.
7. Use the **EN-51146-2-6-1** slider outside to push down the combustion fuel injector seal on the **EN-51146-2-2** mounting sleeve-short.
8. Push the combustion fuel injector seal over the **EN-51146-2-3** mounting sleeve-short, use the **EN-51146-2-6-1** slider outside to the fuel injector.
9. Remove the **EN-51146-2-3** mounting sleeve-short with the **EN-51146-2-1** stylus from the **EN-51146-2-6-1** slider outside.

Fig. 172: Fuel Injector Limiter

Courtesy of GENERAL MOTORS COMPANY

10. Before using the **EN-51146-2-4** pre-sizing tool (1), check if the fuel injector limiter (2) is in the right position.

Fig. 173: Pre-Sizing Tool And Fuel Injector
Courtesy of GENERAL MOTORS COMPANY

NOTE: First form the combustion fuel injector seals a bit with finger and thumb.

11. Push the **EN-51146-2-4** pre-sizing tool (1) over the fuel injector (2).

Fig. 174: Pre-Sizing Tool
Courtesy of GENERAL MOTORS COMPANY

12. Tighten the nut (2) and counterhold at the spanner flat of the **EN-51146-2-4** pre-sizing tool thread (1) until the measure (a) of 4.5 mm (0.177 in) is reached.
13. Loosen the nut (2) of the **EN-51146-2-4** pre-sizing tool.

Fig. 175: Take Off Chassis And Pre-Sizing Tool

Courtesy of GENERAL MOTORS COMPANY

14. Install the **EN-51146-2-4-7** take off chassis (2) to the **EN-51146-2-4** pre-sizing tool (3).
15. Install the **EN-51146-2-4-6** screw M10 (1) to the **EN-51146-2-4-7** take off chassis (2), and tighten until the **EN-51146-2-4** pre-sizing tool (3) is loosened.

Fig. 176: Calibration Tool And Fuel Injector

Courtesy of GENERAL MOTORS COMPANY

16. Install the **EN-51146-2-5** calibration tool (2) rotary to the fuel injector (1), as shown in the graphic.
17. Remove the **EN-51146-2-5** calibration tool from the fuel injector.

Fig. 177: Installing Seal

Courtesy of GENERAL MOTORS COMPANY

WARNING: The fuel injector seals must fit properly in the relative groove. Overlapping of the fuel injector seals with the external surface of the injector must be avoided. If the seals are installed incorrectly, it could cause leaks and risk of injury.

18. Check the combustion fuel injector seals (2 seals each fuel injector) for correct seat:

- The seal must not be too large, buckled or corrugated (1).
- The seal must be fixed tight and accurate (2).

19. If the seals are installed not correctly, repeat the steps 27 - 29 of the removal procedure and the steps 1 - 19 of the installation procedure.

Fig. 178: Calibration Tools And Fuel Injectors

Courtesy of GENERAL MOTORS COMPANY

20. Install the 4 EN-51146-2-5 calibration tools (2) rotary to the fuel injectors (1).

21. Remove the fuel injector assembly with the **EN-51146-100** plate from the bench vise.

Fig. 179: Plate, Bolts And Supports

Courtesy of GENERAL MOTORS COMPANY

22. Remove the 8 plate bolts (1) and remove **EN-51146-100** plate (2), counterhold with a wrench (4) at the **EN-51146-1-1** supports (3).

Fig. 180: Support, Fuel Injector And Bolt

Courtesy of GENERAL MOTORS COMPANY

NOTE: Never loosen both **EN-51146-1-1** supports at the same time. Failure to follow this caution could cause leaks or malfunction after installation. It is only possible, when the fuel injector will be replaced.

23. Remove one **EN-51146-1-1** support (2) from the fuel injector (3).

NOTE: DO NOT reuse the old fuel injector bolt.

24. Apply thread lock agent to the NEW fuel injector bolt (1).
25. Install NEW fuel injector bolt to the fuel injector and tighten to 5 N.m (44 lb in).

Fig. 181: Support, Fuel Injector And Bolt
Courtesy of GENERAL MOTORS COMPANY

26. Remove the EN-51146-1-1 support (1) from the fuel injector (3).

NOTE: DO NOT reuse the old fuel injector bolt.

27. Apply thread lock agent to the NEW fuel injector bolt (2).
28. Install a NEW fuel injector bolt to the fuel injector and tighten to 5 N.m (44 lb in).
29. Repeat the steps 22 - 27 for the other 3 injectors.
30. Clean the fuel injector bores at the cylinder head. Refer to [Fuel Injector and Fuel Injector Bore Cleaning and Inspection](#) .

Fig. 182: Fuel Injector Rail Assembly Bolts, Decoupling Elements And Retainer
Courtesy of GENERAL MOTORS COMPANY

31. Inspect the fuel injector rail assembly:

- Check the 4 fuel injector for damage.
- Check the 8 fuel injector seals for correct seat.
- Check if all bolts (3) with decoupling elements (1) and retainer (2) are complete.

32. Remove the 4 **EN-51146-2-5** calibration tools from the fuel injector.

Fig. 183: Fuel Rail Assembly

Courtesy of GENERAL MOTORS COMPANY

CAUTION: During the installation of the fuel rail and injector assembly, ensure that the fuel injectors are positioned straight into the injector opening. Failure to follow this caution can tilt or bend the injectors and could cause leaks or malfunction after installation.

33. Install carefully the fuel rail assembly (1).

34. Push the fuel injectors slightly in their seats.

Fig. 184: Fuel Rail Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

35. Tighten the 8 fuel rail bolts in the sequence as shown to 10 N.m (89 lb in).

Fig. 185: Fuel Injection Fuel Rail Wiring Harness And Fuel Rail Bolts

Courtesy of GENERAL MOTORS COMPANY

36. Connect Fuel Injection Fuel Rail Wiring Harness(1)
37. Install [Fuel Feed Intermediate Pipe Replacement](#)
38. Install [Ignition Coil Replacement](#)
39. After replacement of any components of the fuel injection systems, use a scan tool to reset functions. Refer to [Control Module References](#) .

WARNING: Fuel escapes - observe safety measures and national legislation. Failure to comply could result in personal injury.

NOTE: Ensure that all work at the engine is finished.

40. Perform a fuel rail assembly leak test.
 1. Start the engine.
 2. Check the fuel system for leaks.

FUEL INJECTION FUEL RAIL FUEL PRESSURE SENSOR REPLACEMENT

Removal Procedure

WARNING: The noise cancelling foam component **MUST** be replaced if it has been exposed to engine fluids. Failure to replace the noise cancelling foam component that has been exposed to engine fluids may result in an engine fire resulting in catastrophic engine damage, and possible injury or death.

WARNING: Fuel/gasoline vapors are highly flammable. A fire could occur if an ignition source is present. Never drain or store gasoline or diesel fuel in an open container, due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.

WARNING: Wear safety glasses in order to avoid eye damage.

CAUTION: Refer to [Fuel and Evaporative Emission Hose/Pipe Connection Cleaning Caution](#) .

1. Relieve the fuel system pressure. [Fuel Pressure Relief](#)
2. Disconnect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#)
3. Remove Intake Manifold Cover - [Intake Manifold Cover Replacement](#)

Fig. 186: Fuel Injection Fuel Rail Assembly, Fuel Injection Fuel Rail Pressure Sensor And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

4. Disconnect the electrical connector (2).

NOTE:

- Do NOT apply force to the plastic housing of the fuel injection fuel rail fuel pressure sensor. ONLY apply force to the attached hexagon.
- Some fuel may leak from the fuel injection fuel rail orifice after the sensor is removed. Dry the area around the orifice using a lint free cloth.
- After removal, the area around the fuel injection fuel rail sealing surface should be inspected. The surface should be free of fuel, dirt, debris, and burrs.

5. Remove and DISCARD the fuel injection fuel rail fuel pressure sensor (1).

Installation Procedure

Fig. 187: Fuel Injection Fuel Rail Assembly, Fuel Injection Fuel Rail Pressure Sensor And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Component Fastener Tightening Caution](#) .

NOTE:

- Do NOT apply force to the plastic housing of the fuel injection fuel rail fuel pressure sensor. ONLY apply force to the attached hexagon.
- BEFORE installation of the fuel injection fuel rail fuel pressure sensor, the fuel injection fuel rail threads MUST be clean and free of any fuel or the sensor will NOT seal properly.

1. To install the NEW fuel injection fuel rail fuel pressure sensor (1) properly, perform the following steps:
 1. Lubricate the sensor threads and sealing surface with one drop of clean engine oil.
 2. Install the sensor and hand tighten.
 3. Remove the sensor.
 4. Re-lubricate the sensor threads and sealing surface with one drop of clean engine oil.
 5. Install the sensor and tighten to 32 N.m (24 lb ft).
2. Connect the electrical connector (2).
3. Connect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#)

NOTE: If a fuel leak occurs at the fuel injection fuel rail, the fuel rail will need to be replaced.

4. Inspect for leaks using the following procedure:
 1. Turn ON the ignition with the engine OFF for 2 seconds.
 2. Turn OFF the ignition for 10 seconds.
 3. Turn ON the ignition with the engine OFF.
 4. Inspect for fuel leaks.
5. Install Intake Manifold Cover [Intake Manifold Cover Replacement](#)
6. When the replacement is completed, use a scan tool to perform the appropriate reset functions. [Control Module References](#)

FUEL PRESSURE SENSOR REPLACEMENT

Removal Procedure

WARNING: [Diesel/Gasoline Vapors Warning](#)

WARNING: [Safety Goggles and Fuel Warning](#)

1. Relieve the fuel system pressure. [Fuel Pressure Relief](#)
2. Remove [Underbody Front Air Deflector Replacement - Left Side](#)

Fig. 188: Fuel Pressure Sensor, Seal Ring And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect the electrical connector.(1)
4. Place a drain pan under the vehicle.
5. Remove Fuel Pressure Sensor(2)
6. Remove Seal Ring(3) and DISCARD

Installation Procedure

Fig. 189: Fuel Pressure Sensor, Seal Ring And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW seal.(3)

CAUTION: **Component Fastener Tightening Caution**

2. Install Fuel Pressure Sensor (2) and tighten 15 N.m (11 lb ft)

3. Connect the electrical connector.(1)
4. Remove the drain pan.
5. Install [Underbody Front Air Deflector Replacement - Left Side](#)
6. Cycle the ignition to run the fuel pump and check for fuel leaks.

FUEL INJECTION PUMP REPLACEMENT

Special Tools

- **BO-38185** Hose Clamp Pliers
- **EN-51365** High Pressure Fuel Pump Installation Alignment Gauge

Equivalent regional tools:[Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#)

Removal Procedure

WARNING: The noise cancelling foam component **MUST** be replaced if it has been exposed to engine fluids. Failure to replace the noise cancelling foam component that has been exposed to engine fluids may result in an engine fire resulting in catastrophic engine damage, and possible injury or death.

WARNING: Refer to [Diesel/Gasoline Vapors Warning](#) .

WARNING: Refer to [Safety Goggles and Fuel Warning](#) .

1. Relieve the fuel system pressure. [Fuel Pressure Relief](#)
2. Disconnect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#)
3. Drain the cooling system. [Cooling System Draining and Filling](#)
4. Remove Air Inlet Grille Panel [Air Inlet Grille Panel Replacement](#)
5. Remove Intake Manifold Cover [Intake Manifold Cover Replacement](#)
6. Remove Air Cleaner Outlet Duct [Air Cleaner Outlet Duct Replacement](#)

Fig. 190: Air Cleaner Resonator Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

7. Remove the engine wiring harness clip (1) from the bracket.
8. Remove the air cleaner resonator bracket bolt (2).
9. Remove the air cleaner resonator bracket (3).

Fig. 191: Fuel Feed Front Pipe Bracket And Nut

Courtesy of GENERAL MOTORS COMPANY

10. Remove the fuel feed front pipe bracket nut (1).
11. Remove the fuel feed front pipe bracket (2) from the stud.
12. Disconnect the fuel feed front pipe (3) from the fuel pump and reposition pipe and bracket as necessary.

Fuel Feed Front Pipe Replacement

Fig. 192: Fuel Feed Intermediate Pipe

Courtesy of GENERAL MOTORS COMPANY

NOTE: High pressure fuel feed pipes are one time use only. ALWAYS install a NEW high pressure fuel feed pipe if the pipe is removed OR the fittings are loosened.

13. Remove and DISCARD the fuel feed intermediate pipe. [Fuel Feed Intermediate Pipe Replacement](#)
14. Close all open connections with the EN-6015 plugs.

Fig. 193: Heater Water Auxiliary Pump Hose And Clip
Courtesy of GENERAL MOTORS COMPANY

15. Use the **BO-38185** pliers to disengage the heater water auxiliary pump hose clamp (1).
16. Remove the heater water auxiliary pump hose (2) from the water outlet.
17. Remove the heater water auxiliary pump hose (2) from the clip (3) and reposition the hose as necessary.

Fig. 194: Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

18. Disconnect the electrical connector (1).

Fig. 195: Engine Wiring Harness Ground Bolt And Harness Clips

Courtesy of GENERAL MOTORS COMPANY

19. Remove the engine wiring harness ground bolt (1).
20. Remove the engine wiring harness clips (2) from the engine wiring harness bracket.

NOTE: Disconnect any engine wiring harness electrical connectors from sensors, including the fuel pump, as necessary, to provide enough space to work in the area around the fuel pump.

21. Reposition the engine wiring harness (3) as necessary.

Fig. 196: Engine Wiring Harness Bracket and Bolts

Courtesy of GENERAL MOTORS COMPANY

22. Remove the engine wiring harness bracket bolts (1).
23. Remove the engine wiring harness bracket (2).

Fig. 197: Fuel Pump Insulator

Courtesy of GENERAL MOTORS COMPANY

24. Remove the fuel pump insulator (1).

Fig. 198: Fuel Pump Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Alternately loosen the fuel pump bolts one turn at a time until the pump is fully disengaged from fuel pump lifter follower. Trying to remove the pump bolts without even side-to-side loosening may result in pump plunger damage

25. Remove and DISCARD the fuel pump bolts (1).

NOTE: Ensure that during removal of the fuel pump that the valve lifter follower does NOT fall apart.

26. Remove the fuel pump (2).

NOTE:

- The valve lifter follower **MAY** remain in the cylinder head bore after removing the fuel pump.
- If the valve lifter follower does **NOT** pull out of the cylinder head bore with the fuel pump, then remove it afterwards.

27. Remove the valve lifter follower (3).

Fig. 199: Fuel Pump Housing Seal

Courtesy of GENERAL MOTORS COMPANY

28. Remove and DISCARD the fuel pump housing seal (1).

Installation Procedure

1. Before continuing, lubricate the cylinder head bore with clean engine oil.

Fig. 200: Valve Lifter Follower

Courtesy of GENERAL MOTORS COMPANY

2. Lubricate the valve lifter follower (1) with clean engine oil and install it into the cylinder head bore.

NOTE:

- The camshaft **MUST** be at the base circle position before the fuel pump is installed.
- At the base circle position, the EN-51365 alignment gauge will sit flush with the cylinder head.

3. Install the **EN-51365** alignment gauge (2) and turn the crankshaft until the camshaft lobe is at the base circle position.

4. Remove the **EN-51365** alignment gauge (2) and valve lifter follower (1).

Fig. 201: Fuel Pump Housing Seal

Courtesy of GENERAL MOTORS COMPANY

5. Lubricate the NEW fuel pump housing seal (1) with clean engine oil and install it on the fuel pump.

Fig. 202: Fuel Pump Bolts And Fuel Pump Bolt Retainers

Courtesy of GENERAL MOTORS COMPANY

CAUTION: This vehicle is equipped with torque-to-yield or single use fasteners. Install a NEW torque-to-yield or single use fastener when installing this component. Failure to replace the torque-to-yield or single use fastener could cause damage to the vehicle or component.

NOTE:

- ALWAYS make sure the fuel pump bolt retainers are present before installing the fuel pump bolts.
- If ANY fuel pump bolt retainers are missing or NOT suitable for reuse, replace the retainers as necessary.

6. Install the NEW fuel pump bolts (1) through the fuel pump bolt retainers (2).

Fig. 203: Valve Lifter Follower

Courtesy of GENERAL MOTORS COMPANY

7. Lubricate the valve lifter follower (1) again with clean engine oil, if necessary, and install it into the cylinder head bore.
8. Install the fuel pump assembly (2) into the cylinder head and start the NEW fuel pump bolts (3) by hand.

CAUTION: Refer to [Fastener Caution](#) .

CAUTION: Alternately hand-tighten the fuel pump bolts one turn at a time until the pump is fully seated. Trying to draw down the pump without even side-to-side tightening may result in pump plunger damage.

9. Tighten the NEW fuel pump bolts (3) to 25 N.m (18 lb ft).

Fig. 204: Fuel Pump Insulator

Courtesy of GENERAL MOTORS COMPANY

10. Install the fuel pump insulator (1).

Fig. 205: Engine Wiring Harness Bracket and Bolts

Courtesy of GENERAL MOTORS COMPANY

11. Position the engine wiring harness bracket (2).
12. Install the engine wiring harness bracket bolts (1) and tighten to 25 N.m (18 lb ft).

Fig. 206: Engine Wiring Harness Ground Bolt And Harness Clips

Courtesy of GENERAL MOTORS COMPANY

NOTE: Connect any engine wiring harness electrical connectors to sensors, including the fuel pump, that were previously disconnected.

13. Position the engine wiring harness (3).
14. Install the engine wiring harness clips (2) in the engine wiring harness bracket.
15. Install the engine wiring harness ground bolt (1) and tighten to 10 N.m (89 lb in).

Fig. 207: Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

16. Connect the electrical connector (1).

Fig. 208: Heater Water Auxiliary Pump Hose And Clip

17. Install the heater water auxiliary pump hose (2) to the water outlet.
18. Use the **BO-38185** pliers to engage the heater water auxiliary pump hose clamp (1).
19. Install the heater water auxiliary pump hose (2) in the clip (3).
20. Remove all **EN-6015** plugs.

Fig. 209: Fuel Feed Intermediate Pipe

Courtesy of GENERAL MOTORS COMPANY

NOTE: High pressure fuel feed pipes are one time use only. **ALWAYS** install a **NEW** high pressure fuel feed pipe if the pipe is removed **OR** the fittings are loosened.

21. Install the **NEW** fuel feed intermediate pipe. **Fuel Feed Intermediate Pipe Replacement**

Fig. 210: Fuel Feed Front Pipe Bracket And Nut

Courtesy of GENERAL MOTORS COMPANY

22. Position fuel feed front pipe and bracket as necessary and connect the fuel feed front pipe (3) to the fuel pump. **Fuel Feed Front Pipe Replacement**
23. Position the fuel feed front pipe bracket (2) on the stud.
24. Install the fuel feed front pipe bracket nut (1) and tighten to 9 N.m (80 lb in).

Fig. 211: Air Cleaner Resonator Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

25. Position the air cleaner resonator bracket (3).
26. Install the air cleaner resonator bracket bolt (2) and tighten to 9 N.m (80 lb in).
27. Install the engine wiring harness clip (1) to the bracket.
28. Connect the battery negative cable. **Battery Negative Cable Disconnection and Connection**
29. Inspect for leaks using the following procedure:
 1. Turn ON the ignition with the engine OFF for 2 seconds.

2. Turn OFF the ignition for 10 seconds.
 3. Turn ON the ignition with the engine OFF.
 4. Inspect for fuel leaks.
30. Install Air Cleaner Outlet Duct [Air Cleaner Outlet Duct Replacement](#)
 31. Install Intake Manifold Cover [Intake Manifold Cover Replacement](#)
 32. Install Air Inlet Grille Panel [Air Inlet Grille Panel Replacement](#)
 33. Fill the cooling system. [Cooling System Draining and Filling](#)
 34. When the replacement is completed, use a scan tool to perform the appropriate reset functions. [Control Module References](#)

FUEL SYSTEM CLEANING

WARNING: [Diesel/Gasoline Vapors Warning](#)

The following procedure covers the disassembly and the inspection of the complete fuel supply system. If the fuel system is contaminated, the fuel system can be cleaned. You can usually determine the extent of the fuel system contamination during the disassembly.

1. Remove the fuel tank pump module. Refer to [Fuel Tank Fuel Pump Module Replacement](#).
2. Locate the tank in a suitable work area away from any heat, any flame, or any other source of ignition.
3. Perform the following procedures:
 - Inspect the fuel tank pump module strainer. Replace the fuel tank pump module if the strainer is contaminated.

WARNING: Wear safety glasses when using compressed air, as flying dirt particles may cause eye injury.

NOTE: Only use oil-free compressed air to blow out the fuel pipes.

- Use compressed air in order to apply air pressure to the transfer tube.

NOTE: When flushing the fuel tank, handle the fuel and water mixture as a hazardous material. Handle the fuel and water in accordance with all applicable local, state, and federal laws and regulations.

4. Flush the fuel tank with running hot water for at least five minutes. Pour the water out of the fuel pump module opening. Rock the fuel tank in order to ensure that the removal of the water from the fuel tank is complete.
5. Refer to [Metal Collar Quick Connect Fitting Service](#) in order to disconnect the fuel feed hose/pipe.
6. Use compressed air in order to apply air pressure to the fuel lines in the opposite direction from the normal fuel flow.
7. Remove the fuel rail and the fuel injectors. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#).
8. Clean and inspect the fuel injectors and the fuel rail.

Installation Procedure

Assemble the fuel system as follows:

1. Install the direct fuel injectors and the fuel rail. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#).
2. Install the fuel tank pump module. Refer to [Fuel Tank Fuel Pump Module Replacement](#).
3. Refer to [Metal Collar Quick Connect Fitting Service](#) in order to connect the fuel feed hose/pipe.

4. Remove all **EN-6015** plugs from the connections.
5. Connect Fuel Feed Front Pipe(2)@Fuel Feed Pipe(1)[Metal Collar Quick Connect Fitting Service](#)
6. Install Fuel Feed Front Pipe(2)@Retainer(3)
7. Install [Air Cleaner Outlet Duct Replacement](#)
8. Connect [Battery Negative Cable Disconnection and Connection](#)
9. Cycle the ignition to run the fuel pump and check for fuel leaks.

FUEL FEED INTERMEDIATE PIPE REPLACEMENT

Removal Procedure

WARNING: Refer to [Diesel/Gasoline Vapors Warning](#) .

WARNING: Refer to [Safety Goggles and Fuel Warning](#) .

1. Relieve the fuel system pressure. [Fuel Pressure Relief](#)
2. Disconnect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#)
3. Remove Intake Manifold Cover [Intake Manifold Cover Replacement](#)
4. Remove Air Cleaner Outlet Duct [Air Cleaner Outlet Duct Replacement](#)

Fig. 216: Air Cleaner Resonator Bracket, Bolt And Wiring Harness Clip
 Courtesy of GENERAL MOTORS COMPANY

5. Unclip Wiring Harness Clip (1)
6. Remove the air cleaner resonator bracket bolt (1).
7. Remove the air cleaner resonator bracket (2).

Fig. 217: Fuel Feed Intermediate Pipe, Bolt And Nuts
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Lay a lint-free cloth under the fuel feed intermediate pipe to absorb any excess fuel spillage.

8. Remove the fuel feed intermediate pipe bolt (1).
9. Loosen the fuel feed intermediate pipe fittings (2, 5) at the fuel injection fuel rail (3) and the fuel pump (4).

NOTE: High pressure fuel feed pipes are one time use only. ALWAYS install a

NEW high pressure fuel feed pipe if the pipe is removed OR the fittings are loosened.

10. Remove and DISCARD the fuel feed intermediate pipe (6).

Installation Procedure

Fig. 218: Fuel Feed Intermediate Pipe, Bolt And Nuts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Component Fastener Tightening Caution](#) .

NOTE: High pressure fuel feed pipes are one time use only. ALWAYS install a NEW high pressure fuel feed pipe if the pipe is removed OR the fittings are loosened.

1. To install the NEW fuel feed intermediate pipe (6) perform the following steps:
 1. Hand tighten the fuel feed intermediate pipe fitting (2) to the fuel injection fuel rail (3).
 2. Hand tighten the fuel feed intermediate pipe fitting (5) to the fuel pump (4).
 3. Tighten the fuel feed intermediate pipe fittings (2, 5) to 30 N.m (22 lb ft).

CAUTION: Refer to [Fastener Caution](#) .

2. Install the fuel feed intermediate pipe bolt (1) and tighten to 10 N.m (89 lb in).

Fig. 219: Air Cleaner Resonator Bracket, Bolt And Wiring Harness Clip
Courtesy of GENERAL MOTORS COMPANY

3. Position the air cleaner resonator bracket (2).
4. Install the air cleaner resonator bracket bolt (1) and tighten to 9 N.m (80 lb in).
5. Install Wiring Harness Clip (1)
6. Connect the battery negative cable. [Battery Negative Cable Disconnection and Connection](#)

WARNING: Fuel escapes - observe safety measures and national legislation. Failure to comply could result in personal injury.

7. Inspect for leaks using the following procedure:
 1. Turn ON the ignition with the engine OFF for 2 seconds.
 2. Turn OFF the ignition for 10 seconds.
 3. Turn ON the ignition with the engine OFF.
 4. Inspect for fuel leaks.
8. Install Air Cleaner Outlet Duct [Air Cleaner Outlet Duct Replacement](#)
9. Install Intake Manifold Cover [Intake Manifold Cover Replacement](#)

EVAPORATIVE EMISSION CANISTER REPLACEMENT

Removal Procedure

WARNING: [Safety Goggles and Fuel Warning](#)

WARNING: [Fuel Vapors in Evaporative Emission Components Warning](#)

1. Remove [Evaporative Emission Canister Bracket Replacement](#)

Fig. 220: Evaporative Emission Canister, Control Valve Hose, Electrical Connector And Retaining Tab

Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the evaporative emission canister control valve hose (4). Refer to [Plastic Collar Quick Connect Fitting Service](#).
3. Disconnect the electrical connector.(5)
4. Release the retaining tab (2) using a flat bladed tool (1) while simultaneously sliding the canister in direction of arrow.
5. Remove Evaporative Emission Canister(3)

Installation Procedure

Fig. 221: Evaporative Emission Canister, Control Valve Hose, Electrical Connector And Retaining Tab

Courtesy of GENERAL MOTORS COMPANY

1. Install Evaporative Emission Canister(3) -

2. Slide the evaporative emission canister (3) against the direction of arrow until the retaining tab (2) is locked.
3. Connect the electrical connector.(5)
4. Connect the evaporative emission canister control valve hose (4). Refer to [Plastic Collar Quick Connect Fitting Service](#).
5. Install [Evaporative Emission Canister Bracket Replacement](#)

 1. Evaporative Emission System Vacuum Leak Detection Pump (1)
 2. Fuel Tank Pressure Sensor (3)
 3. Fuel Tank Fuel Pump Module Wiring Harness (5).

5. Disconnect Evaporative Emission Rear Hose (6)[Plastic Collar Quick Connect Fitting Service](#)
6. Disconnect Evaporative Emission Pipe (7)[Plastic Collar Quick Connect Fitting Service](#)
7. Disconnect the evaporative emission system vacuum leak pump filter pipe (2). Refer to [Plastic Collar Quick Connect Fitting Service](#).
8. Close all open connection with the **EN-6015** plugs.
9. Remove Retainer (4)

Fig. 223: Evaporative Emission Canister Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Remove the 4 evaporative emission canister bracket nuts (2).

NOTE: A second technician is required.

11. Lower the evaporative emission canister bracket (1) until the evaporative emission canister control valve wiring harness is accessible.

Fig. 224: Electrical Connector And Retainers

Courtesy of GENERAL MOTORS COMPANY

12. Disconnect the electrical connector.(2)
13. Remove Retainer(1)
14. Lay the evaporative emission canister bracket on a bench.

Disassemble Procedure

Fig. 225: Evaporative Emission Canister And Vacuum Leak Pump Components

Courtesy of GENERAL MOTORS COMPANY

1. Remove Retainer(1)
2. Remove the evaporative emission system vacuum leak pump cover (4).

NOTE: Use a flat bladed tool to release the 2 retaining tabs.

3. Remove the evaporative emission system vacuum leak pump (3).
4. Remove the evaporative emission canister control valve vacuum hose (6). Refer to [Plastic Collar Quick Connect Fitting Service](#).
5. Remove the 2 evaporative emission canister vent solenoid valve bolts (1).
6. Remove the evaporative emission canister (2) along with the evaporative emission canister vent solenoid valve (7) and the evaporative emission canister hose. Refer to [Evaporative Emission Canister Replacement](#).

Assemble Procedure

Fig. 226: Evaporative Emission Canister And Vacuum Leak Pump Components

Courtesy of GENERAL MOTORS COMPANY

1. Install the evaporative emission canister (2) along with the evaporative emission canister vent solenoid valve (7) and the evaporative emission canister hose. Refer to [Evaporative Emission Canister Replacement](#).

CAUTION: [Fastener Caution](#)

2. Install the 2 evaporative emission canister vent solenoid valve bolts (1) and tighten to 7 N.m (62 lb in).
3. Install the evaporative emission canister control valve vacuum hose (6). Refer to [Plastic Collar Quick Connect Fitting Service](#).

NOTE: **There must be 2 noticeable click noises.**

4. Install the evaporative emission system vacuum leak pump (3).
5. Install the evaporative emission system vacuum leak pump cover (4).
6. Install Retainer(5)

Installation Procedure

NOTE: **A second technician is required.**

1. Raise the evaporative emission canister bracket until the evaporative emission canister control valve wiring harness is accessible.

Fig. 227: Electrical Connector And Retainers

8. Disconnect the electrical connector:
 1. Evaporative Emission System Vacuum Leak Detection Pump (1)
 2. Fuel Tank Pressure Sensor(3)
 3. Fuel Tank Fuel Pump Module Wiring Harness (5).
9. Disconnect Evaporative Emission Rear Hose (6)[Plastic Collar Quick Connect Fitting Service](#)
10. Disconnect Evaporative Emission Pipe(7) [Plastic Collar Quick Connect Fitting Service](#)
11. Disconnect the evaporative emission system vacuum leak pump filter pipe (2). Refer to [Plastic Collar Quick Connect Fitting Service](#).
12. Close all open connection with the **EN-6015** plugs.
13. Remove Retainer(4)

Fig. 255: Evaporative Emission Canister Bracket And Nuts

Courtesy of GENERAL MOTORS COMPANY

14. Remove the 4 evaporative emission canister bracket nuts (2).
15. Remove the evaporative emission canister bracket (1) and put it on a workbench.

Fig. 256: Electrical Connector And Retainers

Courtesy of GENERAL MOTORS COMPANY

16. Disconnect the electrical connector.(2)
17. Remove Retainer(1)
18. Remove the evaporative emission canister vacuum leak pump wiring harness.

Installation Procedure

Fig. 257: Electrical Connector And Retainers

Courtesy of GENERAL MOTORS COMPANY

1. Install the evaporative emission canister vacuum leak pump wiring harness.

2. Install Retainer
3. Connect the electrical connector.

Fig. 258: Evaporative Emission Canister Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

4. Install the evaporative emission canister bracket (1).

CAUTION: Fastener Caution

5. Install the 4 evaporative emission canister bracket nuts (2) and tighten to 9 N.m (80 lb in).

Fig. 259: Electrical Connectors, Evaporative Emission Rear Hose, Evaporative Emission Pipe, Vacuum Leak Pump Filter Pipe And Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Install Retainer(4)
7. Remove the **EN-6015** plugs from all connections.

8. Connect the evaporative emission system vacuum leak pump filter pipe (2). Refer to [Plastic Collar Quick Connect Fitting Service](#).
9. Connect Evaporative Emission Pipe (7) [Plastic Collar Quick Connect Fitting Service](#)
10. Connect Evaporative Emission Rear Hose (6) [Plastic Collar Quick Connect Fitting Service](#)
11. Connect the electrical connector:
 1. Evaporative Emission System Vacuum Leak Detection Pump (1)
 2. Fuel Tank Pressure Sensor(3)
 3. Fuel Tank Fuel Pump Module Wiring Harness (5).

Fig. 260: Wiring Harness Clips

Courtesy of GENERAL MOTORS COMPANY

12. Install Wiring Harness Clip(1)
13. Install [Underbody Rear Air Deflector Replacement](#)

Fig. 261: Electrical Connectors And Wiring Harness Clips

Courtesy of GENERAL MOTORS COMPANY

14. Install Wiring Harness Clip(2, 3)
15. Connect the electrical connectors.(1)
16. Install Rear Wheelhouse Liner Replacement
17. Lower the vehicle.
18. Connect Battery Negative Cable Disconnection and Connection

EVAPORATIVE EMISSION SYSTEM VACUUM LEAK PUMP FILTER REPLACEMENT

Removal Procedure

1. Remove Fuel Tank Filler Pipe Replacement

Fig. 262: Evaporative Emission System Vacuum Leak Pump Filter, Bracket, Cable Straps And Clip
Courtesy of GENERAL MOTORS COMPANY

2. Remove the 3 cable straps (1, 4).
3. Remove Clip (3)
4. Unclip the evaporative emission system vacuum leak pump filter (2) from the bracket (5).

Installation Procedure

Fig. 263: Evaporative Emission System Vacuum Leak Pump Filter, Bracket, Cable Straps And Clip
Courtesy of GENERAL MOTORS COMPANY

1. Install the evaporative emission system vacuum leak pump filter (2) to the bracket (5).
2. Install Clip (3)
3. Install the 3 cable straps (1, 4).
4. Install [Fuel Tank Filler Pipe Replacement](#)

EVAPORATIVE EMISSION SYSTEM VACUUM LEAK DETECTION PUMP REPLACEMENT

Removal Procedure

WARNING: [Safety Goggles and Fuel Warning](#)

WARNING: [Fuel Vapors in Evaporative Emission Components Warning](#)

1. Disconnect [Battery Negative Cable Disconnection and Connection](#)
2. Raise and support the vehicle. [Lifting and Jacking the Vehicle](#)
3. Remove [Underbody Rear Air Deflector Replacement](#)

Fig. 264: Evaporative Emission System Vacuum Leak Pump Cover, Filter Pipe, Retainers And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

4. Remove Retainer (4)
5. Remove the evaporative emission system vacuum leak pump cover (3).
6. Disconnect the evaporative emission system vacuum leak pump filter pipe (1). Refer to [Plastic Collar Quick Connect Fitting Service](#).
7. Disconnect the electrical connector.(2)

Fig. 265: Evaporative Emission System Vacuum Leak Pump And Retaining Tabs

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a flat bladed tool to release the 2 retaining tabs (2).

8. Remove the evaporative emission system vacuum leak pump (1).

Installation Procedure

Fig. 266: Evaporative Emission System Vacuum Leak Pump And Retaining Tabs
 Courtesy of GENERAL MOTORS COMPANY

NOTE: There must be 2 noticeable click noises.

1. Install the evaporative emission system vacuum leak pump (1).

Fig. 267: Evaporative Emission System Vacuum Leak Pump Cover, Filter Pipe, Retainers And Electrical Connector
 Courtesy of GENERAL MOTORS COMPANY

2. Connect the electrical connector.(2)
3. Connect the evaporative emission system vacuum leak pump filter pipe (1). Refer to [Plastic Collar Quick Connect Fitting Service](#).
4. Install the evaporative emission system vacuum leak pump cover (3).
5. Install Retainer(4)
6. Lower the vehicle.

7. Install [Underbody Rear Air Deflector Replacement](#)
8. Connect [Battery Negative Cable Disconnection and Connection](#)

IGNITION COIL REPLACEMENT

Removal Procedure

1. Remove Intake Manifold Cover [Intake Manifold Cover Replacement](#)

Fig. 268: Ignition Coil Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Ignition Coil Electrical Connector (1)

Fig. 269: Ignition Coils And Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove Ignition Coil Bolt (1)
4. Remove Ignition Coil (2)

Installation Procedure

1. Inspect the inside of the ignition coil boot for a thin, even coat of dielectric grease. If there is no grease present or additional grease is necessary, continue to the next step.
2. Apply a thin coating of dielectric grease to the inside of the ignition coil boot up to a depth of 15 mm (0.60 in) from the end of the boot.
3. Remove any excess dielectric grease from around the end of the ignition coil boot and ensure there is not an excessive amount within the boot.

Fig. 270: Ignition Coils And Bolts

Courtesy of GENERAL MOTORS COMPANY

4. Install Ignition Coil (2)

CAUTION: Refer to [Fastener Caution](#) .

5. Install Ignition Coil Bolt (1) and tighten 10 N.m (89 lb in)

Fig. 271: Ignition Coil Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

6. Connect Ignition Coil Electrical Connector (1)
7. Install Intake Manifold Cover [Intake Manifold Cover Replacement](#)

SPARK PLUG INSPECTION

Spark Plug Usage

1. Ensure that the correct spark plug is installed. An incorrect spark plug causes driveability conditions. Refer to [Ignition System Specifications](#) for the correct spark plug.
2. Ensure that the spark plug has the correct heat range. An incorrect heat range causes the following conditions:
 - Spark plug fouling - Colder plug
 - Pre-ignition causing spark plug and/or engine damage - Hotter plug

Spark Plug Inspection

[Fig. 272: Cross Sectional View Of Spark Plug](#)

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the terminal post (1) for damage.

- Inspect for a bent or broken terminal post (1).
- Test for a loose terminal post (1) by twisting and pulling the post. The terminal post (1) should NOT move.

Fig. 273: Inspecting Spark Plug For Flashover Or Carbon Tracking Soot

Courtesy of GENERAL MOTORS COMPANY

2. Inspect the insulator (2) for flashover or carbon tracking, soot. This is caused by the electrical charge traveling across the insulator (2) between the terminal post (1) and ground. Inspect for the following conditions:

- Inspect the spark plug boot for damage.
- Inspect the spark plug recess area of the cylinder head for moisture, such as oil, coolant, or water. A spark plug boot that is saturated causes arcing to ground.

Fig. 274: Inspecting Spark Plug Insulator

Courtesy of GENERAL MOTORS COMPANY

3. Inspect the insulator (2) for cracks. All or part of the electrical charge may arc through the crack instead of the electrodes (3, 4).

Fig. 275: Cutaway/Description View Of Spark Plug

Courtesy of GENERAL MOTORS COMPANY

4. Inspect for evidence of improper arcing.
 - Measure the gap between the center electrode (4) and the side electrode (3) terminals. Refer to [Ignition System Specifications](#) . An excessively wide electrode gap can prevent correct spark plug operation.
 - Inspect for the correct spark plug torque. Insufficient torque can prevent correct spark plug operation. An over torqued spark plug, causes the insulator (2) to crack.
 - Inspect for signs of tracking that occurred near the insulator tip instead of the center electrode (4).
 - Inspect for a broken or worn side electrode (3).
 - Inspect for a broken, worn, or loose center electrode (4) by shaking the spark plug.
5. A rattling sound indicates internal damage.
6. A loose center electrode (4) reduces the spark intensity.
 - Inspect for bridged electrodes (3, 4). Deposits on the electrodes (3, 4) reduce or eliminates the gap.
 - Inspect for worn or missing platinum pads on the electrodes (3, 4) If equipped.

- Inspect for excessive fouling.
- Inspect the spark plug recess area of the cylinder head for debris. Dirty or damaged threads can cause the spark plug not to seat correctly during installation.

Spark Plug Visual Inspection

1. Normal operation - Brown to grayish-tan with small amounts of white powdery deposits are normal combustion by-products from fuels with additives.
2. Carbon Fouled - Dry, fluffy black carbon, or soot caused by the following conditions:
 - Rich fuel mixtures
 - Leaking fuel injectors
 - Excessive fuel pressure
 - Restricted air filter element
 - Incorrect combustion
 - Reduced ignition system voltage output
 - Weak coils
 - Worn ignition wires
 - Incorrect spark plug gap
 - Excessive idling or slow speeds under light loads can keep spark plug temperatures so low that normal combustion deposits may not burn off.
 - Deposit Fouling - Oil, coolant, or additives that include substances such as silicone, very white coating, reduces the spark intensity. Most powdery deposits will not effect spark intensity unless they form into a glazing over the electrode.

SPARK PLUG REPLACEMENT

Fig. 276: Spark Plugs

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
<u>Ignition Coil Replacement</u>	
1	Spark Plug (Qty: 4) CAUTION: Refer to:<u>Component</u> <u>Fastener</u> <u>Tightening</u> <u>Caution</u> Tighten 17 N.m (13 lb ft)

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE REPLACEMENT - INTAKE

Fig. 277: Camshaft Position Actuator Solenoid Valve - Intake

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure <u>Intake Manifold Cover Replacement</u>	
1	Camshaft Position Actuator Solenoid Valve Bolt CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve Procedure 1. Disconnect the electrical connector. 2. Install a NEW O-ring seal.

CAMSHAFT POSITION ACTUATOR SOLENOID VALVE REPLACEMENT - EXHAUST

Fig. 278: Camshaft Position Actuator Solenoid Valve - Exhaust

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure <u>Intake Manifold Cover Replacement</u>	
1	Camshaft Position Actuator Solenoid Valve Bolt CAUTION: Refer to <u>Fastener Caution</u> . Tighten 10 N.m (89 lb in)
2	Camshaft Position Actuator Solenoid Valve Procedure 1. Disconnect the electrical connector. 2. Install a NEW O-ring seal.

CRANKSHAFT POSITION SENSOR REPLACEMENT

Fig. 279: Crankshaft Position Sensor (FWD)
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Lifting and Jacking the Vehicle 2. Disconnect the electrical connector.	
1	Crankshaft Position Sensor Bolt CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)
2	Crankshaft Position Sensor Procedure Perform the crankshaft position variation learn. Crankshaft Position Variation Learn

CAMSHAFT POSITION SENSOR REPLACEMENT - INTAKE

Fig. 280: Camshaft Position Sensor - Intake

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures <u>Intake Manifold Cover Replacement</u> <u>Air Cleaner Outlet Duct Replacement</u>	
1	Camshaft Position Sensor Bolt CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 10 N.m (89 lb in)
2	Camshaft Position Sensor Procedure Disconnect the electrical connector.

CAMSHAFT POSITION SENSOR REPLACEMENT - EXHAUST

Fig. 281: Camshaft Position Sensor - Exhaust

Callout	Component Name
Preliminary Procedure	
<u>Intake Manifold Cover Replacement</u>	
1	Camshaft Position Sensor Bolt CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 10 N.m (89 lb in)
2	Camshaft Position Sensor Procedure Disconnect the electrical connector.

AIR CLEANER ASSEMBLY REPLACEMENT

Removal Procedure

Fig. 282: Air Cleaner Outlet Duct, Air Cleaner Assembly, Clamp And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the electrical connector.(1)
2. Loosen Air Cleaner Outlet Duct Clamp (2)
3. Remove Air Cleaner Outlet Duct (3) @Air Cleaner Assembly (4)

Fig. 283: Air Cleaner Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Remove Air Cleaner Assembly (1)
5. Transfer parts as necessary.

Installation Procedure

Fig. 284: Air Cleaner Assembly

Courtesy of GENERAL MOTORS COMPANY

1. Install Air Cleaner Assembly (1)

Fig. 285: Air Cleaner Outlet Duct, Air Cleaner Assembly, Clamp And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

2. Install Air Cleaner Outlet Duct (3) @Air Cleaner Assembly (4)

CAUTION: Refer to:[Fastener Caution](#)

3. Air Cleaner Outlet Duct Clamp (2) - Tighten 2.5 N.m (22 lb in)
4. Connect the electrical connector.(1)

AIR CLEANER ELEMENT REPLACEMENT

Removal Procedure

Fig. 286: Air Cleaner Outlet Duct, Air Cleaner Assembly, Clamp And Electrical Connector
 Courtesy of GENERAL MOTORS COMPANY

1. Disconnect the electrical connector.(1)
2. Loosen Air Cleaner Outlet Duct Clamp (2)
3. Remove Air Cleaner Outlet Duct (3) @Air Cleaner Assembly (4)

7. Remove Air Cleaner Outlet Duct (2) @Air Cleaner Assembly (3)
8. Remove Air Cleaner Outlet Duct (2) @Throttle Body (1)

Installation Procedure

Fig. 292: Air Cleaner Outlet Duct, Air Cleaner Assembly And Throttle Body
Courtesy of GENERAL MOTORS COMPANY

1. Install Air Cleaner Outlet Duct(2)@Throttle Body(1)
2. Install Air Cleaner Outlet Duct(2)@Air Cleaner Assembly(3)

Fig. 293: Air Cleaner Outlet Duct Clamp
Courtesy of GENERAL MOTORS COMPANY

3. Connect Positive Crankcase Ventilation Tube(3) [Plastic Collar Quick Connect Fitting Service](#)

CAUTION: [Fastener Caution](#)

NOTE: Ensure the outlet duct is fully seated to the mating surfaces before clamping. Verify that the cuff is not rolled under.

- 4. Air Cleaner Outlet Duct Clamp(1, 4) - Tighten 2.5 N.m (22 lb in)
- 5. Air Cleaner Outlet Duct Bracket Bolt(5) - Tighten 9 N.m (80 lb in)
- 6. Install Air Cleaner Outlet Duct Fastener (2) and tighten 9 N.m (80 lb in)
- 7. Install [Dash Upper Extension Panel Opening Cover Replacement](#)
- 8. Install [Intake Manifold Cover Replacement](#)

ACCELERATOR PEDAL REPLACEMENT

Fig. 294: Accelerator Pedal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Accelerator Pedal Fastener (Qty: 2) CAUTION: Refer to Fastener Caution .

Callout	Component Name
	Tighten 6 N.m (53 lb in)
2	Accelerator Pedal Assembly Procedure Disconnect the electrical connector.

FUEL LEVEL SENSOR REPLACEMENT

Removal Procedure

1. Remove Fuel Tank Fuel Pump Module Replacement

Fig. 295: Fuel Level Sensor, Fuel Pump Module, Retaining Brackets And Electrical Connector
 Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the electrical connector.(1)
3. Push the 2 retaining brackets (3) in direction of arrows.
4. While holding the 2 retaining brackets (3) move the fuel level sensor (2) upwards and remove the fuel level sensor (2) from the fuel pump module (4).

Installation Procedure

Fig. 296: Fuel Level Sensor, Fuel Pump Module, Retaining Brackets And Electrical Connector
 Courtesy of GENERAL MOTORS COMPANY

NOTE: There must be 2 noticeable click noises.

1. Install the fuel level sensor (2) to the fuel pump module (4).
2. Connect the electrical connector.(1)
3. Install [Fuel Tank Fuel Pump Module Replacement](#)

FUEL PUMP POWER CONTROL MODULE REPLACEMENT

Fig. 297: Fuel Pump Power Control Module

Callout	Component Name
Preliminary Procedures <u>Quarter Lower Rear Trim Panel Replacement (Left Side)</u> <u>Quarter Lower Rear Trim Panel Replacement (Right Side)</u>	
1	Fuel Pump Power Control Module Nut (Qty: 2) CAUTION: <u>Fastener</u> <u>Caution</u> Tighten 9 N.m 80 lb in)
2	Fuel Pump Power Control Module Procedure 1. Disconnect the electrical connector. 2. When the replacement is completed, use a scan tool to perform the appropriate reset functions. <u>Control Module References</u> .

HEATED OXYGEN SENSOR REPLACEMENT - SENSOR 1

Fig. 298: Heated Oxygen Sensor-Sensor 1

Callout	Component Name
WARNING: In order to avoid being burned, do not service the exhaust system while it is still hot. Service the system when it is cool. WARNING: Avoid contact with HOT components. Wear safety glasses and protective gloves to avoid personal injury. Preliminary Procedure Disconnect the battery negative cable. <u>Battery Negative Cable Disconnection and Connection</u>	
1	Heated Oxygen Sensor CAUTION: Refer to <u>Component Fastener Tightening Caution</u> . CAUTION: Refer to <u>Heated Oxygen and Oxygen Sensor Caution</u> .

Callout	Component Name
	CAUTION: Refer to Heated Oxygen Sensor Resistance Learn Reset Caution . CAUTION: The use of excessive force may damage the threads in the exhaust manifold/pipe. Procedure 1. Disconnect the electrical connector. 2. Programming and Setup Control Module References Tighten 42 N.m (31 lb ft) Special Tools J-39194 Oxygen Sensor Wrench Equivalent regional tools: Special Tools (Diagnostic Tools) Special Tools (Repair Tools)

IGNITION SYSTEM SPECIFICATIONS

Application	Specification
-------------	---------------

Application	Specification
Ignition Type	Individual Ignition Coils
Firing Order	1 - 3 - 4 - 2
Spark Plug Torque	Refer to Fastener Specifications
Spark Plug Gap	Refer to Engine Mechanical Specifications
Spark Plug Type	Refer to Electronic Parts Catalog

FASTENER SPECIFICATIONS

Single Use Non-Threaded Fasteners/Components

NOTE: <i>All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.</i>	
Application	
Camshaft Position Actuator Solenoid Valve Seal	
Combustion Fuel Injector Seal	
Engine Coolant Temperature Sensor Seal	
Evaporative Emission System Vacuum Leak Pump Filter Cable Strap	
Exhaust Gas Recirculation Cooler Gasket	
Exhaust Gas Recirculation Cooler Outlet Pipe Seal	
Fuel Injector O-ring	
Fuel Injector Wiring Harness Cable Tie	
Fuel Injector Wiring Harness Tape	
Fuel Pump Housing Seal	
Fuel Pressure Sensor Seal	
Fuel Tank Fuel Pump Module Seal	
Throttle Body Gasket	

Single Use Threaded Fastener/Component Tightening Specifications

NOTE: <i>All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.</i>	
Application	Specification
	Metric (English)

NOTE:

All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.

Application	Specification
	Metric (English)
Fuel Feed Intermediate Pipe/Fitting	30 N.m (22 lb ft)
Fuel Injection Fuel Rail Fuel Pressure Sensor (In Sequence)	32 N.m (24 lb ft)
Fuel Injector Bolt (In Sequence)	5 N.m (44 lb in)
Fuel Pump Bolt (In Sequence)	25 N.m (18 lb ft)

Reusable Threaded Fastener Tightening Specifications**NOTE:**

All fasteners listed in this table can be reused after removal.

Application	Specification
	Metric (English)
Accelerator Pedal Fastener	6 N.m (53 lb in)
Air Cleaner Outlet Duct Bracket Bolt	9 N. m (80 lb in)
Air Cleaner Outlet Duct Clamp	2.5 N.m (22 lb in)
Air Cleaner Outlet Duct Fastener	9 N.m (80 lb in)
Air Cleaner Resonator Bracket Bolt	9 N.m (80 lb in)
Air Cleaner Upper Housing Bolt	2.5 N.m (22 lb in)
Camshaft Position Actuator Solenoid Valve Fastener	10 N.m (89 lb in)
Camshaft Position Sensor Bolt	10 N.m (89 lb in)
Crankshaft Position Sensor Bolt	10 N.m (89 lb in)
Engine Control Module Bracket Nut	9 N.m (80 lb in)
Engine Oil Pressure Sensor	35 N.m (26 lb ft)
Engine Wiring Harness Bracket Bolt @ Exhaust Gas Recirculation Valve	9 N.m (80 lb in)
Engine Wiring Harness Bracket Bolt @ Fuel Pump	25 N.m (18 lb ft)
Engine Wiring Harness Bracket Nut @ Exhaust Gas Recirculation Valve	9 N.m (80 lb in)
Engine Wiring Harness Ground Bolt	10 N.m (89 lb in)
Evaporative Emission Canister Bracket Nut	9 N.m (80 lb in)

NOTE:

All fasteners listed in this table can be reused after removal.

Application	Specification	
	Metric (English)	
Evaporative Emission Canister Purge Solenoid Valve Bolt	10 N.m (89 lb in)	
Evaporative Emission Canister Vent Solenoid Valve Bolt	7 N.m (62 lb in)	
Exhaust Gas Recirculation Cooler Bolt	10 N.m (89 lb in)	
Exhaust Gas Recirculation Cooler Temperature Sensor	42 N.m (31 lb ft)	
Exhaust Gas Recirculation Pipe Bolt	10 N.m (89 lb in)	
Exhaust Gas Recirculation Valve Bolt	10 N.m (89 lb in)	
Fuel Feed Front Pipe Bracket Nut	9 N.m (80 lb in)	
Fuel Feed Intermediate Pipe Bracket Bolt	10 N.m (89 lb in)	
Fuel Injection Fuel Rail Bolt (In Sequence)	10 N.m (89 lb in)	
Fuel Pressure Sensor	15 N.m (11 lb ft)	
Fuel Pump Power Control Module Nut	9 N.m (80 lb in)	
Fuel Tank Filler Pipe Bolt	9 N.m (80 lb in)	
Fuel Tank Filler Pipe Clamp	3.5 N.m (31 lb in)	
Fuel Tank Filler Pipe Ground Bolt	9 N.m (80 lb in)	
Fuel Tank Strap Bolt	22 N.m (16 lb ft)	
Ground Cable Bolt	10 N.m (89 lb in)	
Heated Oxygen Sensor	42 N.m (31 lb ft)	
Ignition Coil Bolt	10 N.m (89 lb in)	
Knock Sensor Bolt	25 N.m (18 lb ft)	
Manifold Absolute Pressure Sensor Bolt	10 N.m (89 lb in)	
Mass Airflow Sensor Bolt	2.5 N.m (22 lb in)	
Spark Plug	17 N.m (13 lb ft)	
Throttle Body Bolt	10 N.m (89 lb in)	

APPROXIMATE FLUID CAPACITIES

GENERAL INFORMATION
State Emission Standards - Gasoline

ALASKA

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

NOTE: As of March 1, 2012, Alaska is not testing for tailpipe emissions.

ALASKA EMISSION STANDARDS - ANCHORAGE & FAIRBANKS (2-SPEED IDLE TEST)

Application	Idle HC ppm (CO %)	2500 RPM HC ppm (CO %)
Passenger Cars ⁽¹⁾		
1968-71	1000 (5.0)	1000 (4.0)
1972-74	1000 (4.0)	1000 (3.0)
1975-80	1000 (2.0)	1000 (2.0)
1981-83	1000 (1.0)	1000 (1.0)
1984-93	750 (1.0)	750 (1.0)
1994-	200 (0.5)	200 (0.5)
Light & Medium Duty Trucks ⁽¹⁾		
1968-72	1000 (5.0)	1000 (4.0)
1973-78	1000 (4.0)	1000 (3.0)
1979-83	1000 (2.0)	1000 (2.0)
1984-93	750 (1.0)	750 (1.0)
1994-	220 (0.5)	220 (0.5)
Heavy Duty Vehicles ⁽²⁾		
1968-73	1000 (5.0)	1000 (5.0)
1974-93	1000 (4.0)	1000 (4.0)
1994-	220 (1.0)	220 (1.0)
(1) 8500 GVWR or less. (2) 8500 GVWR or more.		

ARIZONA

NOTE: Curb idle only test are for vehicles with full-time 4WD, non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on 1967-80 light-duty gasoline powered vehicles and all heavy-duty gasoline powered vehicles.

ARIZONA EMISSION STANDARDS - PHOENIX AREA (CURB IDLE & LOADED CRUISE TESTS)

Application ⁽¹⁾	Idle HC ppm (CO %)	⁽²⁾ Loaded/Cruise HC
----------------------------	--------------------	---------------------------------

		ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)		
1967-71 4-Cyl. Or Less	500 (5.50)	500 (4.20)
1967-71 More Than 4-Cyl.	450 (5.00)	450 (3.75)
1972-74 4-Cyl. Or Less	400 (5.50)	400 (4.20)
1972-74 More Than 4-Cyl.	400 (5.00)	400 (3.75)
1975-78 4-Cyl. Or Less	250 (2.20)	250 (1.65)
1975-78 More Than 4-Cyl.	250 (2.00)	250 (1.50)
Light Duty Vehicles (8500 GVWR Or Less)		
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.20)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	
Light Duty Trucks (6000 GVWR Or Less)		
1967-80	(3)	(3)
Light Duty Trucks (6001-8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)
1979 4-Cyl. Or Less	220 (2.20)	220 (1.65)
1979 More Than 4-Cyl.	220 (2.00)	220 (1.50)
1980	220 (1.20)	220 (1.20)
1981 & Newer	220 (1.20)	
Heavy Duty Trucks (Greater Than 8500 GVWR)		
1967-74	(3)	(3)
1975-78	350 (4.00)	350 (3.00)
1979 & Newer	300 (4.00)	300 (3.00)
Motorcycles		
1967 & Newer	1800 (5.50)	
(1) 4-stroke engines only.		
(2) Except AWD, non-defeatable traction control and motorcycles.		
(3) Same as light duty vehicles.		

ARIZONA EMISSION STANDARDS - PHOENIX AREA (IM147 TEST)

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles		
1981-82	3.0 (25.0)	3.5
1983-85	2.4 (20.0)	3.5
1986-89	1.6 (15.0)	2.5
1990-93	1.0 (12.0)	2.5
1994 & Newer	0.8 (12.0)	2.0
Light Trucks (6000 GVWR Or Less)		

Application	HC gpm (CO gpm)	NOx gpm
1981-85	4.0 (40.0)	5.5
1986-89	3.0 (25.0)	4.5
1990-93	2.0 (20.0)	4.0
1994 & Newer	1.6 (20.0)	3.0
Light Duty Trucks (6000-8500 GVWR)		
1981-85	4.4 (48.0)	7.0
1986-87	4.0 (40.0)	5.5
1988-89	3.0 (25.0)	5.5
1990-93	3.0 (25.0)	5.0
1994 & Newer	2.4 (25.0)	4.0

NOTE: Curb idle test only for 1967-80 light-duty gasoline vehicles, all vehicles with full-time 4WD and/or non-defeatable traction control and motorcycles. Curb idle and loaded cruise tests are performed on all 1981 and later vehicles except those with full-time 4WD and/or non-defeatable traction control.

Fig. 2: California Emission Standards - Enhanced & Partially Enhanced Program Areas - Heavy Duty Vehicles (ASM Test)

LEGEND

ESC - Emission Standard Category

GVWR - Manufacture's Gross Vehicle Weight Rating

LVW - Loaded Vehicle Weight

PC - Passenger Car

LDT1 - Light-Duty Truck up through 3750 LVW and GVWR no greater than 6000 lbs.

LDT2 - Light-Duty Truck greater than 3750 LVW and GVWR no greater than 6000 lbs.

MDV - Medium-Duty Vehicle, GVWR from 6001 to 8500 lbs.

HC - Hydrocarbon, ppm

CO - Carbon Monoxide, %

NO - Nitric Oxide, ppm

PASS/FAIL EMISSION STANDARDS = A+B / VTW

PASS/FAIL STANDARDS - Emission standards used to determine if a vehicle passes the emission inspection. A vehicle passes if the emission levels are equal to or less than the standards for HC, CO and NO for ASM 5015 and ASM 2525.

GROSS POLLUTER STANDARDS - Emission standards used to designate a vehicle as a gross polluter. A vehicle is designated as a gross polluter if the emission levels at the time of the initial inspection, before repairs are greater than the gross polluter standards for HC, CO or NO for ASM 5015 or ASM 2525.

NOTE: If test data on emission pass/fail rates or gross polluter identification rates indicate adjustments are required, the emission standards may be increased or decreased by the bureau by 30% or by the following tolerances, or standards may be set for any specific vehicle and engine configuration which the bureau determines has excessive errors of commission or omission, whichever is necessary to comply with Section 44001.5 of the Health and Safety Code.

COLORADO

U. S. EPA REVISED FINAL ASM EMISSION STANDARDS (ASM5015 & ASM2525)

NOTE: EPA has not published a revised final standards for High Altitude, Light Duty Trucks 2 (6000-8500 GVWR), or vehicles older than 1980 model year. EPA guidance as of February 2003 states that a program may choose to use combinations of the Original and the Revised Final Standards.

U.S. EPA REVISED FINAL ASM EMISSION STANDARDS

Application	ASM5015		ASM2525	
	HC ppm (CO %)	NOx ppm	HC ppm (CO %)	NOx ppm
Passenger Cars				
1980	275 (1.3)	8500	500 (2.3)	4750
1981-82	275 (1.3)	3600	500 (2.3)	3500

Application	ASM5015		ASM2525	
HC ppm (CO %)		NOx ppm	HC ppm (CO %)	NOx ppm
1983-89	275 (1.1)	3600	500 (1.6)	3500
1990 & Newer	275 (1.1)	3600	300 (1.6)	3500
Light Duty Trucks (Less Than 6000 GVWR)				
1980-83	1140 (9.7)	14,145	340 (23.28)	32,200
1984-87	537 (5.4)	14,145	160 (12.96)	32,200
1988-95	537 (5.4)	7380	160 (12.96)	16,800
1996 & Newer	275 (1.1)	6150	82 (4.40)	14,000

U.S. EPA IM240 EMISSION STANDARDS

START-UP STANDARDS

Start-up standards should be used during the first 2 years of program operation. Tier 1 standards are recommended for all 1996 and newer vehicles and may be used for 1994 and newer vehicles certified to Tier 1 standards as well.

U.S. EPA IM240 HYDROCARBONS EMISSION START-UP STANDARDS

Application	Hydrocarbons (Grams/Mile)	
Composite	Phase 2	
Light Duty Vehicles		
1996 & Newer	0.80	0.50
1991-95	1.20	0.75
1983-90	2.00	1.25
1980-82	2.00	1.25
1975-79	7.50	5.00
1968-74	10.0	6.00
High Altitude Light Duty Vehicles		
1983-84	2.00	1.25
1982	2.00	1.25

GENERAL INFORMATION
State Emission Standards

ARIZONA

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL OPACITY LOADED CRUISE TEST)

Application		Altitude (Feet)	Opacity (% For 10 Seconds)
Light Duty Vehicles (8500 GVWR Or Less)			
All Years		Less Than 2000	20 Or Less
Â	Â	2001-4000	30 Or Less
Â	Â	Greater Than 4000	40 Or Less

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL J1667 SNAP IDLE TEST)

Application		Altitude (Feet)	Opacity (% For 10 Seconds)
Heavy Duty Vehicles (8500 GVWR Or Greater)			
1990 & Earlier		All	55
1991 & Newer		All	40

COLORADO

COLORADO EMISSION STANDARDS - DIESEL OPACITY

Application		Opacity %
14,000 GVWR Or Less		
Non-Turbo		40
Turbo		35
14,000 GVWR Or More		
Non-Turbo		35
Turbo		20

CONNECTICUT

CONNECTICUT EMISSION STANDARDS - DIESEL OPACITY

Application		Opacity %
10,000 GVWR Or Less		
1979 & Newer		20
26,000 GVWR Or More		

Application	Opacity %
1974 & Earlier	70
1974-90	55
1991 & Newer	40

IDAHO

IDAHO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
All Weight Range	
1965-74	70
1975-91	55
1992 & Newer	40

KENTUCKY

KENTUCKY EMISSION STANDARDS - BOONE, CAMPBELL & KENTON COUNTIES (DIESEL OPACITY)

Application	Opacity
18,000 GVWR Or Less	
All Years	10% @ Idle

MASSACHUSETTS

Battery Charger Control Module System Voltage Low Voltage

Circuit/System Description

The vehicle control modules or sensors monitor the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 9 V or greater than 18 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Circuit/System Verification

1. Ignition OFF, disconnect the drive motor battery charger cable from the X98 Hybrid/EV Battery Charger Receptacle. Measure and record the battery voltage at the battery terminals.
2. Verify the battery voltage stabilizes between 12.4 and 12.8 V within a few minutes of turning the ignition OFF.
 - **If battery voltage is less than 12.4 V or more than 12.8 V**

Refer to Battery Inspection/Test.

- **If battery voltage is between 12.4 and 12.8 V**
3. Engine running, headlights ON, measure and record the battery voltage at the battery terminals.
 4. Verify the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.
 - **If the voltage is not at least 1 V greater than the voltage measured in step 1 or is greater than 15 V.**

Refer to DC Power Conversion Test .

- **If the voltage is at least 1 V greater than the voltage measured in step 1, but less than 15 V.**
5. Verify the appropriate control module battery voltage and ignition voltage parameters are available in the scan tool.
 - **If parameters are not available in the scan tool**

Refer to Circuit/System Testing

- **If parameters are available in the scan tool**

6. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.

- **If not within 1 V of the battery voltage**

Refer to Circuit/System Testing

- **If within 1 V of the battery voltage**

7. All OK.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- **Control modules the vehicle is equipped with**
- **The control module's ground, B+, and Ignition circuit terminal IDs and connectors**

NOTE: Some control module ground circuits may require up to 20 min after the ignition is turned off before achieving a resistance reading of less than 10 Ω . In most cases the readings will drop below 20 Ω within 1 min indicating the control module is going to sleep.

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between each ground circuit terminal and ground.

- **If 10 Ω or greater**

1. Ignition OFF.

2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , repair the open/high resistance in the ground connection.

- **If less than 10 Ω**

3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the B+ circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

4. Ignition ON.

5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Ignition OFF.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Ignition OFF.

2. Test for infinite resistance between the ignition circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance, replace the appropriate control module.

- **If the test lamp illuminates**

6. Replace the control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC B1516: BATTERY CURRENT SENSOR

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC B1516 08

Battery Current Sensor Signal Invalid

DTC B1516 66

Battery Current Sensor Wrong Mounting Position

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	B1516 08	B1516 08	B1516 08	-
Signal	B1516 08	B1516 08	B1516 08	B1516 08, B1516 66
Low Reference	-	B1516 08	-	-

Circuit/System Description

The battery current sensor is a 3-wire hall effect current sensor. The body control module (BCM) supplies 5 V and ground to the battery current sensor. The battery current sensor measures the amount of current flowing to or from the battery, and supplies a pulse width modulation (PWM) signal to the BCM.

Conditions for Running the DTC

B1516 08

The BCM is awake.

B1516 66

- The BCM is awake.
- The engine is OFF.

Conditions for Setting the DTC

B1516 08

The battery current signal is less than 4 percent or greater than 96 percent duty cycle for 2 minutes.

B1516 66

The battery current polarity is positive for 2 minutes.

Action Taken When the DTC Sets

The regulated voltage control (RVC) is disabled.

Conditions for Clearing the DTC

The DTC passes when the battery current returns to the normal range for 15 seconds.

Diagnostic Aids

DTC B1516 08 could be set by overcharging with a battery charger or jump starting.

Circuit/System Testing

B1516 08

1. Vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the B18 Battery Current Sensor.
It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 30 Ω between the low reference circuit terminal 2 and ground.
 - **If 30 Ω or greater**
 1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If less than 30 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the 5 V reference circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
 3. Test for less than 2 Ω in the 5 V reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K9 Body Control Module.
 - **If greater than 5.2 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the 5 V reference circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K9 Body Control Module.
 - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.
 - **If less than 4.8 V**
 1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K9 Body Control Module.

• **If greater than 5.2 V**

1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.

- If 1 V or greater, repair the short to voltage on the circuit.
- If less than 1 V, replace the K9 Body Control Module.

• **If between 4.8 - 5.2 V**

6. Test or replace the B18 Battery Current Sensor.

B1516 66

1. Verify that the B18 Battery Current Sensor is installed securely around the negative battery cable, with the tape tab pointing away from the negative terminal on the C1 Battery.

• **If the B18 Battery Current sensor is not installed correctly**

Remove and reinstall the B18 Battery Current Sensor properly.

• **If the B18 Battery Current Sensor is installed correctly**

2. Replace the B18 Battery Current Sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

DTC B151A: LOW BATTERY CAPACITY DETECTED

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC B151A 58

Low Battery Capacity Detected

Circuit/System Description

The body control module (BCM) monitors the battery voltage level during an engine crank event to detect a low battery voltage condition.

Conditions for Running the DTC

The vehicle is ON

Conditions for Setting the DTC

A minimum crank battery voltage is less than the minimum crank battery voltage threshold for 16 consecutive crank events.

Action Taken When the DTC Sets

A driver information center message is displayed.

Conditions for Clearing the DTC

The DTC will clear if the minimum crank voltage is greater than the minimum crank voltage threshold during a crank event.

DTC B1527: PARASITIC LOAD

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1527 00

Parasitic Load

Circuit/System Description

The body control module (BCM) monitors the state of charge of the electrical system.

Conditions for Running the DTC

The ignition is in Accessory or Run mode.

Conditions for Setting the DTC

The state of charge at ignition ON is 30% lower than when the engine was running and battery drain is more than 2 A.

Action Taken When the DTC Sets

There is no battery telltale illuminated or DIC message displayed.

Conditions for Clearing the DTC

- The DTC will clear if the fault does not return after 50 consecutive ignition cycles.
- The DTC will clear when run state of charge is greater than or equal to 80%.

DTC P0A8D: 14V POWER MODULE SYSTEM VOLTAGE LOW VOLTAGE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A8D

14V Power Module System Voltage Low Voltage

Circuit/System Description

The 14V power module, often referred to as the accessory DC power control module, converts the high voltage (360V) direct current (DC) to low voltage (14V) DC to charge the 12V battery and to operate the power accessories. The ECM controls the 14V power module by supplying a 5V pulse width modulated (PWM) signal through a control circuit. The ECM monitors 12V battery voltage to ensure the 14V power module is maintaining the desired voltage.

Conditions for Running the DTC

14V power module is commanded ON.

Conditions for Setting the DTC

The ECM monitored battery voltage is less than or equal to 11V for 8 s within a 10 s window.

Action Taken When the DTC Sets

- The charge indicator is illuminated.
- The 14V power module stops supplying power to the 12V system.
- DTC P0A8D is a Type C DTC.

Conditions for Clearing the DTC

DTC P0A8D is a Type C DTC.

Diagnostic Aids

An improperly fastened 200-amp in-line mega-fuse may cause this DTC to set.

Reference Information

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Circuit/System Testing

1. Verify DTC P1F59, P1F5A, P1F5B, P1F5D, or P1F5E is not set.
 - **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) .

- If the DTC is not set

2. Perform the [DC Power Conversion Test](#) .

DTC P1F5D OR P1F5E: 14 VOLT POWER MODULE L-TERMINAL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1F5D

14 Volt Power Module L-Terminal Circuit Low Voltage

DTC P1F5E

14 Volt Power Module L-Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module. The control circuit functions much like the L Terminal circuit on a generator equipped vehicle. A high side driver in the ECM applies a duty cycled voltage to the 14V power module. The duty cycle controls the 14V power module output. The ECM monitors the state of the 14V power module control circuit. The ECM will detect faults on the 14V power module control circuit when the vehicle is ON.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5D: The ECM detects a low voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.
- P1F5E: The ECM detects a high voltage on the 14V power module control circuit for 8 seconds out of a 10 second window.

Action Taken When the DTC Sets

DTCs P1F5D and P1F5E are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F5D and P1F5E are type C DTCs.

Circuit/System Verification

NOTE: Do not have a 12V battery charger connected during the testing.

1. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
2. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K1 14V Power Module, Vehicle On
2. Test for 3.0 - 5.5 V between the signal circuit terminal 1 X1 and ground.

- **If less than 3.0 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the signal circuit and ground.

- If less than infinite resistance, repair the short to ground on the circuit.
- If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.

- If greater the 2 Ω , repair the open/high resistance in the circuit.
- If less than 2 Ω , replace the K20 Engine Control Module.

- **If greater than 5.5 V**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit 1 X1 and ground.

- If greater than 1 V, repair the short to voltage on the circuit.
- If less than 1 V, replace the K20 Engine Control Module.

- **If between 3.0 - 5.5 V**

3. Test or replace the K1 14V Power Module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, programming, and setup

DTC P1F59, P1F5A, OR P1F5B: 14 VOLT POWER MODULE STATUS TERMINAL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P1F59

14 Volt Power Module Status Terminal Circuit Performance

DTC P1F5A

14 Volt Power Module Status Terminal Circuit Low Voltage

DTC P1F5B

14 Volt Power Module Status Terminal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - L Terminal	P1F5D	-	P1F5E	-
Status - F Terminal	P1F59, P1F5A	P1F59, P1F5A	P1F59, P1F5B	P1F59

Circuit/System Description

The ECM uses two circuits to control and monitor the state of the 14V power module, often referred to as the accessory DC power control module.

The status circuit functions much like the F Terminal circuit on a generator equipped vehicle. A high side driver in the 14V power module applies a duty cycled voltage to the ECM. The duty cycle indicates 14V power module internal temperature and operational condition. The ECM will detect faults on the 14V power module status circuit when the vehicle is ON.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

- P1F5A: The ECM detects a 5% or lower PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F5B: The ECM detects a 96% or higher PWM signal on the 14V power module status circuit for 8 seconds out of a 10 second window.
- P1F59: The status circuit PWM signal is not in a valid range.

Action Taken When the DTC Sets

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

Conditions for Clearing the DTC

DTCs P1F59, P1F5A and P1F5B are type C DTCs.

[Circuit/System Verification](#)

1. Vehicle OFF. Connect the vehicle to an AC supply to begin charging
2. Vehicle in Service Mode
3. Verify that DTC P0D26 is not set and that the vehicle will charge
 - **If the DTC is set or the vehicle will not charge**

Refer to DTC P0D26

- **If the DTC is not set**

NOTE: Do not have a 12V battery charger connected during the testing.

- 4.
5. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
6. Verify the DTC does not set.
 - **If the DTC sets**
Refer to Circuit/System Testing, specific to the DTC(s) set
 - **If the DTC does not set**
7. All OK.

Circuit/System Testing

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

- 1.

DTC P1F5A or P1F5B, without P1F59 Diagnosis

1. Vehicle OFF, disconnect the X3 harness connector at the K20 Engine Control Module, Vehicle On
2. Test for 4.6 V - 7.0 V between the signal circuit terminal 19 X3 and ground.
 - **If less than 4.6 V**
 1. Vehicle OFF, disconnect the harness connector at the K1 14V Power Module.
 2. Test for infinite resistance between the signal circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.

- If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If greater the 2 Ω , repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K1 14V Power Module.
 - **If greater than 7.0 V**
 1. Vehicle OFF, disconnect the harness connector at the K1 14V Power Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit 19 X3 and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If less than 1 V, replace the K1 14V Power Module..
 - **If between 4.6 V - 7.0 V**
 3. Test or replace the K20 Engine Control Module.

DTC P1F59 Diagnosis

NOTE: You must perform Circuit/System Verification first

1. Disable the high voltage system for servicing the T18 Battery Charger, K1 14V Power Module and the A4 Hybrid/EV Battery Pack. Refer to High Voltage Disabling
2. Disconnect the X3 connector at the T18 Battery Charger, the X4 connector at the K1 14V Power Module and the X6 connector at the A28 Hybrid/EV Battery Contactor Assembly
3. Verify that all HV harness connector and the mating module connector terminals are free from moisture, corrosion, and arc flash damage.

- **If any terminals show signs of damage**

Replace the HV wiring harness and affected modules as necessary

- **If no arc flash damage, moisture, or corrosion is found**

4. Test the following HV harness terminals for less than 2 Ω end to end:

- X6-1 to X4-B
- X6-1 to X3-1
- X6-2 to X4-A
- X6-2 to X3-2

- **If greater than 2 Ω**

Replace the HV wiring harness

- **If less than 2 Ω**

Replace the K1 14V Power Module

5. Enable high voltage. Refer to High Voltage Enabling
6. Verify the DTC does not set

- **If the DTC sets**

Replace the K20 Engine Control Module

- If the DTC does not set

7. All OK

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

DTC U350B

Control Module Input Power "C" Circuit Intermittent/Erratic

Circuit/System Description

The vehicle control module monitors the system voltage to verify the system voltage is within the normal operating range.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The control module or sensor detects a system voltage of less than approximately 7.5 V or greater than 16 V for approximately 5 seconds.

Action Taken When the DTC Sets

- A driver information center message and/or warning indicator may be displayed.
- The control module may be temporarily disabled.

Conditions for Clearing the DTC

The system voltage returns to normal operating range.

Diagnostic Aids

- A high or low voltage DTC set or voltage value in multiple modules/sensors indicates a concern in the 12 V charging system.
- A possible cause of this DTC could be overcharging with a 12 V battery charger or jump starting.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle OFF, disconnect the drive motor battery charger cable from the X98 Hybrid/EV Battery Charger Receptacle. Measure and record the 12 V battery voltage at the battery terminals. The battery voltage should stabilize between 12.4 and 12.8 V within a few minutes of turning the Vehicle OFF.
 - **If battery voltage is not between 12.4 and 12.8 V**

Refer to [Battery Inspection/Test](#).
 - **If battery voltage is between 12.4 and 12.8 V**
2. Vehicle ON, accessories OFF, measure and record the battery voltage at the battery terminals.
3. Verify the voltage is at least 1 V greater than the minimum voltage measured in step 1, but less than 15 V.
 - **If the voltage is not at least 1 V greater than the minimum voltage measured in step 1 or is greater than 15 V.**

Refer to [DC Power Conversion Test](#).
 - **If the voltage is at least 1 V greater than the minimum voltage measured in step 1, but less than 15 V.**
4. Verify the appropriate control module scan tool battery voltage and ignition voltage parameters are within 1 V of the battery voltage.
 - **If not within 1 V of the battery voltage**

Refer to Circuit/System Testing.
 - **If within 1 V of the battery voltage**
5. All OK.

Circuit/System Testing

NOTE: Use the schematic to identify the following:

- **Which control modules the vehicle is equipped with**
 - **The control modules ground, B+, and Ignition circuit terminal IDs and connectors**
1. Vehicle OFF, and all vehicle systems off, disconnect the scantool and harness connectors at the appropriate control module. It may take up to 2 min for all vehicle systems to power down.
 2. Test for less than 10 Ω between each ground circuit terminal and ground.
 - **If 10 Ω or greater**
 1. Vehicle OFF.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If less than 10 Ω**
 3. Verify a test lamp illuminates between each B+ circuit terminal and ground.
 - **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the B+ circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , verify the fuse is not open and there is voltage at the fuse.

• **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.

• **If the test lamp illuminates**

4. Vehicle ON.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.

• **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF.
2. Test for less than 2 Ω in the ignition circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , refer to [Power Mode Mismatch](#).

• **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the ignition circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the appropriate control module.

• **If the test lamp illuminates**

6. Replace the appropriate control module.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Control Module References](#) for control module replacement, programming and setup.

SYMPTOMS - ENGINE ELECTRICAL

The following steps must be completed before using the symptom tables.

- Perform [Diagnostic System Check - Vehicle](#) before using the Symptom Tables in order to verify that all of the following are true:
 - The power modes are correct.
 - The control modules can communicate via the serial data link.
 - There are no DTCs set.
- Review the system descriptions and operations in order to familiarize yourself with the system functions. Refer to one of the following system operations:
 - [Battery Description and Operation](#)
 - [Charging System Description and Operation](#)

- **Starting System Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the 12 V charging system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Battery Inspection/Test**
- **Battery Charging**
- **Battery Electrical Drain/Parasitic Load Test**
- **Charging System Test**

BATTERY INSPECTION/TEST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

NOTE: For Warranty repairs -

You must use regionally required battery test equipment for warranty repairs.

For accurate test results the battery must be disconnected from the vehicle and the equipment connected directly to the battery posts. When setting up the equipment, select "Out of Vehicle" and then the correct battery type (Flooded, AGM or Stop/Start AGM) and rated CCA (both from the battery label) must be entered.

- **Failure to obtain the correct connections during the test may result in a failed test on a good battery.**
- **Use the Out of Vehicle test (battery disconnected with test equipment connected directly to the posts) for each battery when testing a vehicle with dual batteries.**

Special Tools

EL 50313 Battery Tester For equivalent regional tools, refer to [Special Tools](#)

Circuit/System Testing

WARNING: Unless directed otherwise, the ignition must be OFF with the key removed, and all electrical loads must be OFF before servicing any electrical component. Disconnect the negative battery cable to prevent an electrical spark should a tool or equipment come in contact with an exposed electrical terminal. Failure to follow these precautions may result in personal injury and/or damage to the vehicle or its components.

For Vehicles equipped with OnStar® (UE1) with Back Up Battery:

The Back Up Battery is a redundant power supply to allow limited OnStar® functionality in the event of a main vehicle battery power disruption to the VCIM (OnStar® module). Do not disconnect the main vehicle battery or remove the OnStar® fuse with the ignition key in any position other than OFF. Retained accessory power should be allowed to time out or be disabled (simply opening the driver door should disable retained accessory power) before disconnecting power. Disconnecting power to the OnStar® module in any way while the ignition is On or with retained accessory power activated may cause activation of the OnStar® Back-Up Battery system and will discharge and permanently damage the back-up battery. Once the Back-Up Battery is activated it will stay on until it has completely discharged. The back-up battery is not rechargeable and once activated the back-up battery must be replaced.

1. Verify the C1 Battery or C1B Battery - Auxiliary (if equipped) case is not cracked, broken, or damaged, which may be indicated by battery acid leakage.
 - If there is any apparent damage

Replace the C1 Battery or C1B Battery - Auxiliary.

- **If there is no damage**

2. Verify that the battery cables are clean and tight. The battery terminal bolts should be torqued as specified in [Fastener Specifications](#).

- **If the battery cables need to be cleaned or tightened**

Clean as required and tighten as specified.

- **If the battery cables are clean and tight**

3. Disconnect battery from the vehicle. There is no need to remove the battery from the vehicle.
4. Connect the EL-50313 directly to the battery terminal posts.
5. Select "Charging," "Diagnostic" and "Out of Vehicle" when setting up the test.
6. Select the proper battery type, Flooded, AGM or Stop/Start AGM.
7. Enter the CCA as shown on the battery label.
8. Verify the test result is not REPLACE BATTERY or BAD CELL-REPLACE

NOTE: Always write the test code displayed by the tester on the repair order for any warranty purposes. The number is a unique code that describes the test data for a particular battery at a particular time. The test code may occasionally repeat when you retest the same battery. More often, each test will result in a different code. Use the test code from the Out of Vehicle test.

- **If the test result is REPLACE BATTERY or BAD CELL-REPLACE**

Replace the C1 Battery or C1B Battery - Auxiliary.

- **If the test result is not REPLACE BATTERY or BAD CELL-REPLACE**

9. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Battery Replacement

BATTERY CHARGING

12 V Battery

The following procedure is for the 12 V battery only.

Special Tools

EL 50313 Midtronics GR8 Battery Tester Charger

For equivalent regional tools, refer to [Special Tools](#).

Diagnostic Aids

NOTE: This vehicle is equipped with an Absorbent Glass Matt Battery. This type of battery

requires different charging and testing parameters than the more common regular flooded lead acid type battery. ANY time you perform charging and or testing you MUST set up the charging/testing equipment or permanent damage to the battery may result.

- The charging area should be well ventilated.
- Do not charge a battery that appears to be frozen. Allow the battery to warm to room temperature and test it using the EL 50313 before charging.
- An AGM battery may be damaged if charged to more than 14.5 V.
- A Flooded Cell battery may be damaged if charged to more than 16.5 V.
- Vehicles with dual batteries must be charged individually which will result in two printouts.

Battery State of Charge

NOTE: Using voltage to determine the battery's state of charge is only accurate after the battery has been at rest for 24 hours. This is enough time for the acid in each cell to equalize. If the battery has been charged or discharged in the past 24 hours, the battery state of charge will only be an estimate.

The maintenance-free batteries state of charge is estimated by reading the voltage of the battery across the battery terminals. Because the voltage is affected by current flow into or out of the battery, the engine must be stopped and all electrical loads turned OFF, including parasitic loads, when checking the voltage. The voltage can also be affected if the battery has just been charged or discharged, so it is important to consider what has happened to the battery in the time just before testing. Use the following procedure to determine the battery's state of charge:

1. Be sure all electrical loads are turned OFF.
2. Determine whether the battery has been used in a vehicle or charged within the past 12 hours.
 - If the answer is no, the terminal voltage will be stabilized and no action is necessary before reading the voltage. Skip to step 3.
 - If the answer is yes, terminal voltage will not be stabilized and you should wait 12 hours since the last time the battery was used.
3. Estimate the battery temperature by determining the average temperature to which the battery has been exposed for the past 12 hours.

NOTE: The table is accurate to 10 percent only after the battery has been at rest for 12 hours.

4. Measure the battery voltage at the battery terminals. Refer to the following table to determine the state of charge according to the estimated battery temperature:

Battery Voltage	% Charge at 0Â°C (32Â°F)	% Charge at 25Â°C (75Â°F)
12.75 V	100%	100%
12.7 V	100%	90%
12.6 V	90%	75%
12.45 V	75%	65%
12.2 V	65%	45%
12.0 V	40%	20%

Use the state of charge information as follows:

- A battery with a state of charge that is below 65 percent must always be recharged before returning it to service or continuing storage.
- A battery with a state of charge that is 65 percent or greater is generally considered to be charged enough in order to be returned to normal service or in order to continue storage. However, if the battery is being used in slow traffic or with short drive times, or if the temperature is very hot or very cold, the battery should be fully charged, to at least 90 percent, before returning it to service or continuing storage.

Charging Time Required

The time required to charge a battery will vary depending upon the following factors:

- The battery charger capacity - The higher the charger amperage, the less time it will take to charge the battery.
- The state of charge of the battery - A completely discharged battery requires more than twice as much charging time as a half charged battery. In a discharged battery with a voltage below 11 V, the battery has a very high internal resistance and may only accept a very low current at first. Later, as the charging current causes the acid content to increase in the electrolyte, the charging current will increase. Extremely discharged batteries may not activate the reversed voltage protection in some chargers. Refer to the manufacturer's instructions for operating this circuitry.
- The temperature of the battery - The colder the battery is, the more time it takes to recharge the battery. The charging current accepted by a cold battery is very low at first. As the battery warms, the charging current will increase.

Charging Procedure

CAUTION: Turn OFF the ignition when connecting or disconnecting the battery cables, the battery charger or the jumper cables. Failure to do so may damage the ECM/PCM or other electronic components.

CAUTION: Refer to [Fastener Caution](#) .

When charging side-terminal batteries with the battery cables connected, connect the charger to the positive cable bolt and to a ground located away from the battery. When charging side-terminal batteries with the battery cables disconnected, install the battery side terminal adapters and connect the charger to the adapters.

Use the following procedure to charge the battery:

1. Ensure that all of the battery terminal connections are clean and tight.
2. Connect the charger positive lead to the battery positive terminal on the battery or the remote jumper stud underhood.

CAUTION: Do not connect the negative charger lead to the housings of other vehicle electrical accessories or equipment. The action of the battery charger may damage such equipment.

3. Connect the negative charger lead to a solid engine ground or to a ground stud in the engine compartment that is connected directly to the battery negative terminal, but away from the battery. If the negative battery cable is disconnected and a terminal adapter is being used, connect directly to the adapter.
4. Select "Charging," "PDI" and "In Vehicle" when setting up the charger.

5. Select the proper battery type, Flooded, AGM, Spiral AGM or Stop/Start AGM.
6. Enter the CCA as shown on the battery label.

BATTERY ELECTRICAL DRAIN/PARASITIC LOAD TEST

12 V Battery

The following procedure is for the 12 V battery only.

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

Components most likely to cause a parasitic draw on the vehicle's battery are switches, relays, and control modules. After the vehicle is turned OFF the control modules will begin to go to sleep (shut OFF). All control modules do not go to sleep at the same time, some may take up to 30 minutes or longer after turning the Vehicle OFF before going to sleep, like the HVAC and body control modules. Others such as the telematics communication interface control module and remote control door lock receiver may periodically wake up then go back to sleep. These are all normal conditions.

Diagnostic Aids

- Rule out any possible aftermarket equipment causing an unacceptable parasitic current drain. Aftermarket accessories installed into the courtesy lamp circuit can cause the inadvertent power timer in the body control module (BCM) to keep resetting. This would cause the BCM to remain awake and cause a current drain on the battery.
- Rule out customer driving habits such as regular short trips that do not allow enough time to properly charge the battery. Refer to [Battery Description and Operation](#).
- Verify that the battery and charging system are in proper working order. Refer to [Battery Charging](#), and [Charging System Test](#).
- A battery discharging for no apparent reason while the vehicle is parked can be caused by an intermittent draw, such as a module waking up, or a continuous draw, such as a dome light or stuck relay.
- Some systems and modules such as OnStar[®], and regulated voltage control, if equipped, are designed to wake-up, perform a task, and go back asleep at regular intervals. Refer to [Body Control System Description and Operation](#) for the system or modules description and operation.
- An engine off natural vacuum evaporative test can occur if the engine control module (ECM) determines the drive cycle has met the appropriate criteria immediately after key off. The ECM will stay awake and the vent solenoid will stay energized for as long as 45 minutes. The typical current draw for this is about 1 A.
- The telematics communication interface control module current draw is very low, less than 40 mA, so the OnStar system is left in that "awake" state for up to the first 48 hours. Parasitic draw of up to 40 mA with an occasional spike as high as 80 mA through the telematics communication interface control module for the first 48 hours is normal.
- Some automatic climate control systems can remain in a semi-awake state for up to three hours, actual draw amounts vary by vehicle platform but are typically not greater than 50 mA.
- An extremely low mA current level is consumed by the RKE receiver for monitoring purposes, actual system wake up only occurs when the fobs for the vehicle are used. When other devices on the same RKE operating

frequency are activated, such as the 4 tire pressure monitoring sensors and other vehicle transmitters in the vicinity, the RKE receiver will have a 100 mA spike. These spikes are normal and occur too briefly to have a significant effect on battery drain. Competing signals may cause RKE performance issues such as jamming but should not cause excessive battery draw.

- If an excessive current draw is not present during initial testing, continue periodic testing over a 1-2 hour period to see if the current draw increases and stays above an unacceptable level.

NOTE: The battery specification listed below is a generic specification. Refer to the label on the original battery when testing the battery.

- The battery run down time will vary depending on the batteries reserve capacity. If the reserve capacity is higher, then the battery run down time would be longer. If the reserve capacity is lower, then the battery run down time would be shorter. The graph below indicates roughly how many days a 690 cold cranking amp battery with a 110 minute reserve capacity starting at 80 percent state of charge will last with a constant current draw until it reaches 50 percent state of charge. Differences in battery reserve capacity and temperature will affect the results.

Current Drain	Days
25 mA	33
50 mA	16.5
75 mA	11
100 mA	8.25
250 mA	3.3
500 mA	1.65
750 mA	1
1 A	0.8
2 A	0.4

Special Tools

EL 38758 Parasitic Draw Test Switch

For equivalent regional tools, refer to [Special Tools](#).

Circuit/System Verification

NOTE:

- Most vehicle systems will go to sleep within 30 minutes but it can take up to 2 hours before all systems power down allowing the parasitic draw test to pass. An occasional increase in the parasitic draw is normal as long as it returns within 1 second.
- Closing the door latches/ajar switch while leaving the doors open is recommended, this allows the vehicle systems to perform in a "doors closed" mode while allowing vehicle interior access that may be needed to complete the diagnostic steps.
- Locking doors will arm the vehicle content theft deterrent system if equipped. Failure to arm the system may cause a theft system fault to not be present during testing.
- There are many things that can prevent the vehicle from completely going to sleep and passing the parasitic draw test. Make sure all the conditions listed below are met before performing the parasitic current draw test.
 - Vehicle OFF
 - Retained Accessory Power RAP OFF - open and close the driver door after Vehicle OFF
 - Scan tool not communicating with a vehicle control module - in some cases it may need to be disconnected from the data link connector.
 - All access doors closed
 - Headlamps OFF - auto headlamps disabled
 - Any delay lighting OFF
 - If equipped with an under hood lamp disable it
 - HVAC after blow OFF
 - Any accessory that can work with Vehicle OFF inactive or OFF
 - Wait up to 2 minutes or longer, after all other listed conditions are met

Using an Inductive Pickup Probe

1. Connect an inductive pickup probe to the negative battery cable that can read down to 1 mA.
2. Vehicle OFF, as the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Using the EL 38758 Parasitic Draw Test Switch

WARNING: Refer to [Battery Disconnect Warning](#) .

CAUTION: When a fused jumper wire or digital multimeter is connected to the test switch terminals, always turn the test switch ON before opening any access door, turning the ignition on, or turning any accessory on. This is to prevent damaging the jumper wire or digital multimeter fuse.

NOTE: The switch knob on the EL 38758 switch is marked ON and OFF. When the switch knob is in the ON position, the circuit is closed and electrical current will pass through the switch. When the switch knob is in the OFF position, the circuit is open and electrical current will not pass through the switch.

1. Vehicle OFF, disconnect the battery negative cable from the battery. Refer to [Battery Negative Cable Disconnection and Connection](#).
2. Turn the EL 38758 switch knob to the OFF position.
3. Install the male end of the EL 38758 switch to the battery ground terminal.
4. Install the battery negative cable to the female end of the EL 38758 switch.
5. Turn the EL 38758 switch knob to the ON position.
6. Road test the vehicle and activate all of the accessories such as the radio and air conditioning.
7. Vehicle OFF, connect a 10 A fused jumper wire to the test switch tool terminals.
8. Turn the EL 38758 switch knob to the OFF position. The current now flows through the jumper wire.
9. Check the fuse in the jumper wire. The fuse should be OK.
 - Failed: If the jumper wire fuse is blown, refer to Circuit/System Testing.
 - Passed
10. Turn the EL 38758 switch knob to the ON position. Remove the fused jumper wire.
11. Connect a digital multimeter set to the 10 A DC scale between the test switch tool terminals.
12. Turn the EL 38758 switch knob to the OFF position. The current now flows through the DMM.
13. As the vehicle systems shut down test for less than 30 mA of parasitic current drain.
 - If greater than the specified range, refer to Circuit/System Testing.

Circuit/System Testing

- NOTE:**
- Removing or installing a fuse, relay, or connector, to determine the area causing high parasitic draw may wake up control modules. You must wait for the control modules to go back to sleep before retesting. It is best to install any removed or disconnected components after the diagnosis is completed.
 - Fuses for power mode master components such as the BCM should be removed last to avoid misdiagnosis.
 - If a scan tool is connected to the DLC, either disconnect it or subtract the scan tool current draw from the DMM reading to get the actual vehicle parasitic current draw.

If the vehicle has an unacceptable amount of parasitic current draw, remove each fuse one at a time until the current draw falls to an acceptable level. A drop of more than 10-20 mA, when disabling a single system or circuit, is an indication of an overly high current draw that could be causing the battery drain. Refer to [Power Distribution Schematics](#) to diagnose exactly which circuit of the suspect system is causing the high parasitic drain. The follow is a list of common components that could cause a high current draw:

- Stuck switch
- Stuck relay
- Control module

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

[Control Module References](#) for control module replacement, programming and setup

CHARGING SYSTEM TEST

The accessory power module (APM) supplies the energy that flows between the high voltage (300 volt) direct current (DC) and low voltage (14 volt) DC to charge the 12 volt battery and power accessories. To test the charging system, refer to [DC Power Conversion Test](#).

REPAIR INSTRUCTIONS

BATTERY NEGATIVE CABLE DISCONNECTION AND CONNECTION

Removal Procedure

1. Ensure that all lamps and accessories are turned off.
2. Turn the ignition OFF and remove the ignition key.
3. Disconnect and remove all 12V battery chargers and the AC charger cable from the hybrid battery charger receptacle.

BATTERY POSITIVE AND NEGATIVE CABLE REPLACEMENT (12 V BATTERY TO ACCESSORY DC POWER CONTROL MODULE)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. [High Voltage Disabling](#)
2. Remove Rear Compartment Floor Stowage Trim Compartment [Rear Compartment Floor Stowage Trim Compartment Replacement](#)
3. Disconnect Battery Negative Cable [Battery Negative Cable Disconnection and Connection](#)

5. Install Retainer(2)
6. Lower the vehicle.
7. Connect [Battery Negative Cable Disconnection and Connection](#)

DESCRIPTION AND OPERATION

BATTERY DESCRIPTION AND OPERATION

300 V Battery

For information about the 355 V hybrid drive motor battery, refer to [Drive Motor Battery System Description](#) .

Absorbent Glass Mat Battery

This vehicle is equipped with an absorbent glass mat battery. This is similar to current vehicle lead acid flood batteries, except they use glass mats that absorb electrolytes that are pressed between the plates instead of immersing the plates in electrolytes. This allows a smaller, lighter battery with the same amount of power and is less susceptible to heat.

The maximum permissible voltage allowed for the absorbent glass mat battery is 14.8 V (at room temperature).

12 V Battery

WARNING: Batteries produce explosive gases, contain corrosive acid, and supply levels of electrical current high enough to cause burns. Therefore, to reduce the risk of personal injury when working near a battery:

- Always shield your eyes and avoid leaning over the battery whenever possible.
- Do not expose the battery to open flames or sparks.
- Do not allow the battery electrolyte to contact the eyes or the skin. Flush immediately and thoroughly any contacted areas with water and get medical help.

- Follow each step of the jump starting procedure in order.
- Treat both the booster and the discharged batteries carefully when using the jumper cables.

NOTE: Because of the materials used in the manufacture of automotive lead-acid batteries, dealers and service shops that handle them are subject to various regulations issued by OSHA, EPA, DOT, and various state or local agencies. Other regulations may also apply in other locations. Always know and follow these regulations when handling batteries.

Batteries that are no longer wanted must be disposed of by an approved battery recycler and must never be thrown in the trash or sent to a landfill.

Batteries that are not part of the vehicle itself, not the battery under the hood, must only be transported on public streets for business purposes via approved hazardous material transportation procedures.

Battery storage, charging and testing facilities in repair shops must meet various requirements for ventilation, safety equipment, material segregation, etc.

The maintenance free battery is standard. There are no vent plugs in the cover. The battery is completely sealed except for 2 small vent holes in the side. These vent holes allow the small amount of gas that is produced in the battery to escape.

Battery Ratings

A battery has 2 ratings:

- Cold cranking amperage
- Amp hours

When a battery is replaced use a battery with similar ratings. Refer to the battery specification label on the original battery.

Amp Hours

The amp hour rating tells you how much amperage is available when discharged evenly over a 20 hour period. The amp hour rating is cumulative, so in order to know how many constant amps the battery will output for 20 hours, you have to divide the amp hour rating by 20. Example: If a battery has an amp hour rating of 74, dividing by 20 = 3.75. Such a battery can carry a 3.75 A load for 20 hours before dropping to 10.5 V. (10.5 V is the fully discharged level, at which point the battery needs to be recharged.) A battery with an amp hour rating of 55 will carry a 2.75 A load for 20 hours before dropping to 10.5 V.

Cold Cranking Amperage

The cold cranking amperage is an indication of the ability of the battery to crank the engine at cold temperatures. The cold cranking amperage rating is the minimum amperage the battery must maintain for 30 seconds at -18°C (0°F) while maintaining at least 7.2 V. Refer to the battery specification label on the original battery for the cold cranking amperage rating for this vehicle.

CHARGING SYSTEM DESCRIPTION AND OPERATION

12 V Battery

The following information is for the 12 V battery only.

For information about charging the high voltage drive motor batteries, refer to [**Drive Motor Battery System Description**](#) .

Electrical Power Management Overview

The electrical power management system is designed to monitor and control the charging system and send diagnostic messages to alert the driver of possible problems. This electrical power management system primarily utilizes existing on-board computer capability to maximize the effectiveness of the charging system, manage the load, improve battery state of charge and life, and minimize the system's impact on fuel economy. The electrical power management system performs 3 functions:

- It monitors the battery voltage and estimates the battery condition.
- It takes corrective actions by adjusting the regulated voltage.
- It performs diagnostics and driver notification.

The battery condition is estimated during Vehicle OFF and during Vehicle in Service Mode. During Vehicle OFF the state of charge of the battery is determined by measuring the open-circuit voltage. The state of charge is a function of the acid concentration and the internal resistance of the battery, and is estimated by reading the battery open circuit voltage when the battery has been at rest for several hours.

The state of charge can be used as a diagnostic tool to tell the customer or the dealer the condition of the battery. During Vehicle ON mode, the algorithm continuously estimates state of charge based on adjusted net amp hours, battery capacity, initial state of charge, and temperature.

While running, the battery degree of discharge is primarily determined by a battery current sensor, which is integrated to obtain net amp hours.

In addition, the electrical power management function is designed to perform regulated voltage control to improve battery state of charge, battery life, and fuel economy. This is accomplished by using knowledge of the battery state of charge and temperature to set the charging voltage to an optimum battery voltage level for recharging without detriment to battery life.

Fig. 57: Charging Block Diagram

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K1	K1 14V Power Module
C1	C1 Battery
B18	B18 Battery Current Sensor
K20	K20 Engine Control Module
K9	K9 Body Control Module

Charging System Components

Drive Motor/Generators

The drive motor/generators are serviceable components located within the transmission housing. When the rotors are spun, an alternating current (AC) is induced into the stator windings. This AC voltage is then sent to the drive motor generator power inverter module (PIM) where it is converted to high voltage direct current (DC) power. The output of the PIM is converted into low voltage electrical power by the accessory DC power converter module (APM) for use by the vehicle's electrical system to maintain electrical loads and battery charge.

Body Control Module (BCM)

The body control module (BCM) is a GMLAN device. It communicates with the engine control module (ECM) and the instrument panel cluster for electrical power management operation. The BCM determines the desired voltage set point and sends the information to the APM. The BCM monitors a battery current sensor, the battery positive voltage circuit, and estimated battery temperature to determine battery state of charge.

Battery Current Sensor

The battery current sensor is a serviceable component that is connected to the negative battery cable at the battery. The battery current sensor is a 3-wire hall effect current sensor. The battery current sensor monitors the battery current. It directly inputs to the BCM. It creates a 5 V pulse width modulation (PWM) signal of 128 Hz with a duty cycle of 0 - 100 percent. Normal duty cycle is between 5 - 95 percent. Between 0 - 5 percent and 95 - 100 percent are for diagnostic purposes.

Engine Control Module (ECM)

The ECM receives control decisions based on messages from the BCM.

Instrument Panel Cluster

The instrument panel cluster provides a means of customer notification in case of a failure and a voltmeter. There are 2 means of notification, a charge indicator and a driver information center message of SERVICE BATTERY CHARGING SYSTEM.

Charging System Operation

The purpose of the charging system is to maintain the battery charge and vehicle loads. There are 6 modes of operation and they include:

- Battery Sulfation Mode
- Normal Mode
- Fuel Economy Mode
- Headlamp Mode
- Voltage Reduction Mode
- Plant Assembly Mode

Battery Sulfation Mode

Battery sulfation mode is used to help maintain the battery life. The charging system will enter a battery sulfation mode which tries to increase the vehicle charging when the charging system voltage is less than 13.2 V for about 30 minutes. Once in this mode, the BCM will set a targeted output voltage between 13.9 - 15.5 V for about 5 minutes. Following this 5 minutes, the BCM will then determine which mode to enter depending on the system voltage requirements.

Normal Mode

The BCM will enter Normal Mode whenever one of the following conditions are met.

- The wipers are ON for more than 3 seconds.
- GMLAN Climate Control Voltage Boost Mode Request is true, as sensed by the HVAC control head. High speed cooling fan, rear defogger and HVAC high speed blower operation can cause the BCM to enter the Charge Mode.
- The estimated battery temperature is less than 0°C (32°F).
- Vehicle Speed is greater than 145 km/h (90 mph)
- Current Sensor Fault Exists
- System Voltage was determined to be below 12.56 V
- Tow/Haul Mode is enabled

When any one of these conditions is met, the system will set targeted generator output voltage to a charging voltage between 13.9 - 15.5 V, depending on the battery state of charge and estimated battery temperature.

Fuel Economy Mode

The BCM will enter Fuel Economy Mode when the ambient air temperature is at least 0°C (32°F) but less than or equal to 80°C (176°F), the calculated battery current is greater than -8 A but less than 5 A, and the battery state of charge is greater than or equal to 85 percent. Its targeted APM set-point voltage is the open circuit voltage of the battery and can be between 12.6 - 13.2 V. The BCM will exit this mode and enter Normal Mode when any of the conditions described above are present.

Headlamp Mode

The BCM will enter Headlamp Mode whenever the high or low beam headlamps are ON. Voltage will be regulated between 13.9 - 14.5 V.

Voltage Reduction Mode

The BCM will enter Voltage Reduction Mode when the calculated battery temperature is above 0°C (32°F) and the calculated battery current is greater than -7 A but less than 1 A. Its targeted APM set-point voltage is 12.9 - 13.2 V. The BCM will exit this mode once the criteria are met for Normal Mode.

Plant Assembly Mode

The BCM will increase charging voltage for the first 500 miles of operation in an effort to ensure that the 12 V battery is fully charged when the vehicle is delivered to the customer.

Instrument Panel Cluster Operation

Charge Indicator Operation

The instrument panel cluster illuminates the charge indicator and displays a charging system warning message in the driver information center when the one or more of the following occurs:

- The engine control module (ECM) detects system voltage less than 11 V or greater than 16 V. The instrument panel cluster receives a GMLAN message from the ECM requesting illumination.
- The BCM determines that the system voltage is less than 11 V or greater than 16 V.
- The instrument panel cluster receives a GMLAN message from the BCM indicating there is a system voltage range concern.
- The instrument panel cluster performs the displays test at the start of each Vehicle ON cycle. The indicator illuminates for approximately 3 seconds.
- Vehicle ON, with the engine OFF.

Battery Voltage Gauge Operation

The instrument panel cluster displays the system voltage as received from the BCM over the GMLAN serial data circuit. If there is no communication with the BCM then the gauge will indicate minimum.

This vehicle is equipped with a regulated voltage control system. This will cause the voltmeter to fluctuate between 12 - 14 V, as opposed to non-regulated systems which usually maintain a more consistent reading of 14 V. This fluctuation with the regulated voltage control system is normal system operation and NO repairs should be attempted.

SERVICE BATTERY CHARGING SYSTEM

The BCM and the ECM will send a GMLAN message to the driver information center for the SERVICE BATTERY CHARGING SYSTEM message to be displayed. It is displayed whenever the charge indicator is commanded ON due to a failure.

STARTING SYSTEM DESCRIPTION AND OPERATION

The HQ1 hybrid system does not use a conventional starter. Refer to [Hybrid Modes of Operation Description](#) for information about the starting system.

Typical Scan Tool Data

Radiator Coolant Temperature Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running			
Parameter Normal Range: Varies with ambient temperature			
Radiator Coolant Temperature Sensor Signal	140Â°C (284Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit/System Description

NOTE: The radiator coolant temperature sensor is referred to as B203 Engine Coolant Temperature Sensor 2 in schematics and other areas.

The radiator coolant temperature (RCT) sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. The engine control module (ECM) supplies 5 volts to the RCT signal circuit and supplies a ground to the low reference circuit.

The following table illustrates the difference between temperature, resistance, and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P00B3

- The engine run time is greater than 10 s.
- The intake air temperature (IAT) is colder than 70°C (158°F).
- The DTC runs continuously when the above conditions are met.

P00B4

- The engine run time is greater than 60 s.
- The intake air temperature (IAT) is warmer than -7°C (19°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

P00B3

The ECM detects that the RCT sensor is warmer than 149°C (300°F) for greater than 10 s.

P00B4

NOTE: The scan tool only displays to -40°C (-40°F).

The ECM detects that the RCT sensor is colder than -60°C (-76°F) for greater than 10 s.

Action Taken When the DTC Sets

- DTCs P00B3 and P00B4 are Type B DTCs.
- The cooling fans will be commanded ON by the ECM.
- The Engine Coolant Temperature Gauge is inoperative.
- The AC compressor will be commanded OFF.

Conditions for Clearing the MIL/DTC

DTC P00B3 and P00B4 are Type B DTCs.

Diagnostic Aids

NOTE: The engine coolant temperature (ECT) sensor is mounted on the engine and the radiator coolant temperature (RCT) sensor is mounted on the radiator.

- As the thermostat opens, the RCT sensor temperature should rise steadily, then stabilize once the

thermostat opens completely.

- Test the RCT sensor at various temperature levels in order to evaluate the possibility of a skewed sensor.
- If the vehicle has sat for greater than 8 hours, the RCT sensor and the ECT sensor values should display within 3Â°C (5Â°F).

Circuit/System Verification

1. Engine Running.
2. Verify the scan tool Radiator Coolant Temperature Sensor parameter is between -39 to + 120Â°C (-38 to +248Â°F) and changes with engine run time.
 - **If not between -39 to + 120Â°C (-38 to +248Â°F) or does not change**

Refer to Circuit/System Testing.
 - **If between -39 to + 120Â°C (-38 to +248Â°F) and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Vehicle Off, disconnect the harness connector at the B203 Engine Coolant Radiator Temperature Sensor.
It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 2 Ω between the low reference circuit terminal 2 and ground.
 - **If 2 Ω or greater**
 1. Vehicle Off, disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for less than 2 Ω in the low reference circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
 - **If less than 2 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Radiator Coolant Temperature Sensor parameter is colder than -39°C (-38°F).
 - **If warmer than -39°C (-38°F)**
 1. Vehicle Off, disconnect the X1 harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If colder than -39°C (-38°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the scan tool Radiator Coolant Temperature Sensor parameter is warmer than 140°C (284°F).
 - **If colder than the 140°C (284°F)**
 1. Vehicle Off, disconnect the X1 harness connector at the K20 Engine Control Module, Vehicle in Service Mode.
 2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
 - **If warmer than 140°C (284°F)**
7. Test or replace the B203 Engine Coolant Radiator Temperature Sensor.

Component Testing

1. Vehicle Off, remove the B203 Engine Coolant Radiator Temperature Sensor.

NOTE: A thermometer can be used to test the sensor off the vehicle.

2. Test the B203 Engine Coolant Radiator Temperature Sensor by varying the sensor temperature while measuring the sensor resistance. Compare the readings with the [Temperature Versus Resistance \(Radiator Coolant Temperature Sensor\)](#) table and verify that the resistance is within 5 percent of the specification.

- If not within the specified range, replace the B203 Engine Coolant Radiator Temperature Sensor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

- [Engine Coolant Temperature Sensor Replacement - Water Outlet](#)

for Radiator Coolant Temperature Sensor replacement.

DTC P00B7: ENGINE COOLANT FLOW INSUFFICIENT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptors

DTC P00B7

Engine Coolant Flow Insufficient

Circuit Description

The engine control module (ECM) monitors the temperature of the engine radiator coolant. The ECM controls the thermostat with a pulse width modulated (PWM) signal. The ECM compares the radiator coolant temperature to the engine coolant temperature in order to determine if there sufficient coolant flow through the thermostat.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0116, P0117, and P0118 are not set.
- The engine run time is greater than 45 s.
- The engine coolant temperature is greater than 70°C (158°F).
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

NOTE: The scan tool display range is between -40 and + 150Â°C (-40 and +302Â°F).

The ECM detects the difference between the RCT sensor and the ECT sensor is greater than 45Â°C (81Â°F) when the ECT sensor is warmer than 117Â°C (242Â°F) for greater than 5 s.

Action Taken When the DTC Sets

DTC P00B7 is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P00B7 is a Type B DTC.

Diagnostic Aids

- The thermostat has a mechanical fail-safe in case of an electrical condition with the thermostat heater. The mechanical thermostat will open at approximately 80Â°C (176Â°F). The mechanical thermostat will cycle from approximately 85Â°C (185Â°F) to approximately 102Â°C (215Â°F).
- A resistance condition in the RCT sensor circuits may cause this DTC. This condition results in a greater voltage on the RCT sensor signal circuit, which is interpreted by the ECM as a colder RCT.

Circuit/System Verification

1. Engine Running.
2. Verify DTC P00B3, P00B4, P00B6, P0116, P0117 or P0118 is not set.
 - **If the DTC is set.**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.
 - **If the DTC is not set.**
3. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.
 - **If a condition is found.**

Refer to Cooling System Draining and Filling, and Loss of Coolant.
 - **If a condition is not found.**
4. Verify the engine cooling fan operates when commanding the cooling fan to 90% and back to 20% with a scan tool.
 - **If the cooling fan does not operate**

Refer to [DTC P1485-P1487](#).

- **If the cooling fan operates**

5. Engine Running for 15 min with the A/C OFF.

NOTE: Depending on ambient temperature, it may take up to 4 minutes for the temperature to decrease less than the specified value.

6. Command the Engine Coolant Thermostat Heater to 100 percent with a scan tool, depress the accelerator pedal.

7. Verify the scan tool ECT Sensor parameter decreases to less than 85°C (185°F).

- **If ECT is warmer than 85°C (185°F)**

Refer to Circuit/System Testing.

- **If ECT is colder than 85°C (185°F)**

8. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

9. Verify the DTC does not set.

- **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

10. All OK.

Circuit/System Testing

1. Vehicle OFF, inspect the cooling system for the conditions below. Refer to [Symptoms - Engine Cooling](#).

- Weak coolant solution
- Obstructed radiator air flow or bent radiator fins
- Blocked cooling system passages
- Radiator hoses that are restricted, collapsed, or deteriorated
- Damaged water pump and or belt
- Loss of cooling system pressure
 - Leaking surge tank cap
 - Radiator hoses
- Cylinder head or an engine block that is cracked or plugged
- **If a condition is found**

Repair as necessary.

- **If a condition is not found**

2. Replace the Engine Coolant Thermostat.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Engine Coolant Thermostat Housing Replacement](#) for engine coolant thermostat replacement.

DTC P0597-P0599: ENGINE COOLANT THERMOSTAT HEATER CONTROL CIRCUIT

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Control	P0030, P0036, P0102, P0135, P0137, P0141, P0458, P0598	P0597	P0599, P0690	-

*Opens the fuse that supplies voltage to the engine coolant thermostat

Circuit/System Description

A wax pellet-type thermostat controls the flow of the engine coolant through the engine cooling system. The wax element of the thermostat expands and opens the thermostat when it is heated. The engine coolant thermostat heater uses an electric heating element to help heat the wax pellet opening the thermostat to increase cooling system performance during certain operation conditions. Ignition voltage is supplied directly to the thermostat heater through a fuse. If certain driving conditions are met the engine control module (ECM) controls the thermostat heater by providing a pulse width modulated (PWM) ground.

Conditions for Running the DTCs

- The ignition is ON, or the engine is running.
- The DTCs run continuously once the above condition is met

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the control circuit do not match for greater than 15 seconds.

Action Taken When the DTC Sets

- DTCs P0597, P0598, and P0599 are Type B DTCs.
- The engine control module commands the engine cooling fans ON.

Conditions for Clearing the DTC

DTCs P0597, P0598, and P0599 are Type B DTCs.

Diagnostic Aids

- A low engine coolant level could cause the thermostat heater to overheat and set a DTC.
- Without electric assist the wax pellet thermostat begins to open at 103Â° C (217Â° F) and is fully open at 117Â° C (243Â° F) when the electric energy not assisted.

The mechanical thermostat will open at approximately 80Â°C (176Â°F). The mechanical thermostat will cycle from approximately 85Â°C (185Â°F) to approximately 102Â°C (215Â°F).

Circuit/System Verification

1. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.

- **If a condition is found**

Refer to **Cooling System Draining and Filling**, and **Loss of Coolant**.

- **If a condition is not found**

2. Vehicle in Service Mode.
3. Verify the parameters listed below do not display Malfunction when commanding the Engine Coolant Thermostat Heater 0% - 100% with a scan tool.

- Engine Coolant Thermostat Heater Control Circuit Low Voltage Test Status
- Engine Coolant Thermostat Heater Control Circuit Open Test Status
- Engine Coolant Thermostat Heater Control Circuit High Voltage Test Status

- **If Malfunction is displayed**

Refer to Circuit/System Testing.

- **If Malfunction is not displayed**

4. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that you observed from the freeze frame/failure records data.
5. Verify the DTC does not set.

- **If any DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**

6. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connector at the E41 Engine Coolant Thermostat Heater.
2. Vehicle in Service Mode
3. Verify that a test lamp illuminates between the ignition circuit terminal 1 and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.

2. Test for less than 2 Ω in the ignition circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

NOTE: The ignition circuit may supply voltage to other components. Make sure to test all circuits and components for a short to ground that share the ignition circuit.

-

1. Vehicle OFF, remove the test lamp, and disconnect all components on the circuit.
2. Test for infinite resistance between the ignition circuit and ground
 - If less than infinite resistance, repair the short to ground in the circuit.
 - If infinite resistance
3. Replace the fuse, vehicle in Service Mode.
4. Verify the fuse is good after connecting each of the components one at a time.
 - If the fuse opens, replace the component that opens the fuse when connected.
 - If the fuse is good, all OK.

- **If the test lamp illuminates**

4. Connect a test lamp between the ignition circuit terminal 1 and the control circuit terminal 2, command the Engine Coolant Thermostat Heater to Increase to 100 % and Decrease to 0 % with a scan tool.
5. Verify that a test lamp turns ON and OFF.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the control circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V.
3. Test for less than 2 Ω in the control circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω replace the K20 Engine Control Module

- **If the test lamp turns ON and OFF**

6. Test or replace the E41 Engine Coolant Thermostat Heater.

DTC P112F: RADIATOR COOLANT TEMPERATURE SENSOR NOT PLAUSIBLE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P112F

Radiator Coolant Temperature Sensor Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P00B3	P00B4	P00B4*	P112F
Low Reference	-	P00B4	P00B4*	P112F
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.				

Typical Scan Tool Data

Radiator Coolant Temperature Sensor

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Engine Running in Closed Loop			
Parameter Normal Range: Varies with ambient temperature			
Signal	140Â°C (284Â°F)	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
Low Reference	-	-40Â°C (-40Â°F)	-40Â°C (-40Â°F)*
* Internal ECM or sensor damage may occur if the circuit is shorted to B+.			

Circuit Description

The engine coolant radiator temperature sensor is a variable resistor that measures the temperature of the engine coolant in the radiator. The engine control module (ECM) supplies 5 volts to the engine coolant radiator temperature signal circuit and supplies a ground to the low reference circuit. The purpose of this diagnostic is to determine if the input from the RCT sensor is skewed warmer than normal. The internal clock of the ECM will record the amount of time the engine is OFF. If the required engine OFF time is met at start-up, the ECM will compare the temperature difference between the actual measured RCT and ECT sensors.

The following table illustrates the difference between temperature, resistance, and voltage:

RCT	RCT Resistance	RCT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

- DTCs P00B3, P00B4, P0112, P0113, P0117, P0118, P0502, P0503, P111E or P2610 are not set.
- The vehicle has been OFF for greater than 8 hours before vehicle ON.

- The engine is running.
- The intake air temperature (IAT) is warmer than -7Â°C (19Â°F).
- The fuel level is greater than 10 percent.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM determines the absolute difference of temperature between the RCT start up temperature and ECT start up temperature is greater than 20Â°C (68Â°F).

Action Taken When the DTC Sets

DTC P112F is a Type B DTC.

Conditions for Clearing the MIL/DTC

DTC P112F is a Type B DTC.

Diagnostic Aids

- As the thermostat opens, the radiator coolant temperature sensor signal should rise steadily, then stabilize once the thermostat opens completely.
- Inspect for the correct operation of the engine cooling system and verify the correct coolant level.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Radiator Coolant Temperature Sensor parameter is between -39 to $+120^{\circ}\text{C}$ (-38 to $+248^{\circ}\text{F}$) and changes with engine run time.
 - **If not between -39 to $+120^{\circ}\text{C}$ (-38 to $+248^{\circ}\text{F}$) or does not change**

Refer to Circuit/System Testing.

- **If between -39 to $+120^{\circ}\text{C}$ (-38 to $+248^{\circ}\text{F}$) and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
 4. Verify the DTC does not set.
 - **If the DTC sets**

Refer to Circuit/System Testing.

- **If the DTC does not set**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B203 Engine Coolant Radiator Temperature Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than $5\ \Omega$ between the low reference terminal 2 and ground.
 - **If $5\ \Omega$ or greater**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for less than $2\ \Omega$ in the low reference circuit end to end.
 - If $2\ \Omega$ or greater, repair the open/high resistance in the circuit.
 - If less than $2\ \Omega$, replace the K20 Engine Control Module.
 - **If less than $5\ \Omega$**
3. Vehicle in Service Mode.
4. Verify the scan tool Radiator Coolant Temperature Sensor parameter is colder than -39°C (-38°F).
 - **If warmer than -39°C (-38°F)**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module.
 2. Test for infinite resistance between the signal circuit terminal 1 and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance, replace the K20 Engine Control Module.
 - **If colder than -39°C (-38°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2, Vehicle in Service Mode.
6. Verify the scan tool Radiator Coolant Temperature Sensor parameter is warmer than 140°C (284°F).
 - **If colder than the 140°C (284°F)**
 1. Vehicle OFF, disconnect the harness connector at the K20 Engine Control Module, Vehicle in Service Mode.

2. Test for less than 1 V between the signal circuit and ground.
 - If 1 V or greater, repair the short to voltage on the circuit.
 - If less than 1 V
3. Vehicle OFF
4. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.
- **If warmer than 140 $^{\circ}$ C (284 $^{\circ}$ F)**
7. Test or replace the B203 Engine Coolant Radiator Temperature Sensor.

Component Testing

1. Vehicle OFF, remove the B203 Engine Coolant Radiator Temperature Sensor.

NOTE: A thermometer can be used to the used to test the sensor off the vehicle.

2. Test the engine coolant radiator temperature sensor by varying the sensor temperature while measuring the sensor resistance. Compare the readings with the [Temperature Versus Resistance \(Radiator Coolant Temperature Sensor\)](#) table and verify that the resistance is within 5 percent of the specification.
 - If not within the specified range, replace the B203 Engine Coolant Radiator Temperature Sensor.

DTC Descriptors

DTC P1485

Cooling Fan Output Circuit

DTC P1486

Cooling Fan Output Circuit Low Voltage

DTC P1487

Cooling Fan Output Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cooling Fan Output Circuit	P148B, P1486	P148A, P1485	P148C, P1487	-

Circuit/System Description

The hybrid/EV powertrain control module 2 indirectly controls the radiator fans. When propulsion is active, the engine control module (ECM) processes all requests for the cooling fans to be turned ON regardless of which module originates the request. The ECM decides if and at what speed the cooling fans should operate. The ECM sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed. If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate and the ECM is not awake, the hybrid/EV powertrain control module 2 will control the cooling fans without ECM intervention.

The ECM communicates the fan command PWM signal to the hybrid/EV powertrain control module 2 through the cooling fan speed signal circuit/hardwire circuit and also sends a redundant serial data signal. Since the hardwire circuit is an output from the ECM but an input to the hybrid/EV powertrain control module 2, each module has unique DTCs to monitor the same circuit.

Conditions for Running the DTC

- DTC P2537 is not set.
- The 12 V battery voltage is equal to or greater than 11 V.
- The accessory circuit is active for greater than 5 s.
- The DTCs run continuously when the conditions above are met.

Conditions for Setting the DTC

The ECM detects that the commanded state of the driver and the actual state of the output circuit do not match for greater than 5 s.

Action Taken When the DTC Sets

DTCs P1485, P1486 and P1487 are Type B DTCs.

Conditions for Clearing the DTC

DTCs P1485, P1486 and P1487 are Type B DTCs.

Diagnostic Aids

DTCs P1485, P1486 and P1487 will not keep the cooling fans from operating. If one of these DTCs is set the HPCM 2 will command the cooling fans to 90%. If the cooling fans do not operate, refer to **DTC P148A-P148C** for further diagnosis.

Circuit/System Verification

1. Vehicle ON.
2. Verify DTC P1485, P1486, P1487, P148A, P148B, or P148C is not set.
 - **If the DTC is set**

Refer to Circuit/System Testing.
 - **If the DTC is not set**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.

NOTE: The cooling fan circuit is pulled up to a voltage within the ECM. 3 - 4 V measured on this circuit with the hybrid/EV powertrain control module 2 disconnected is normal.

2. Test for 3 - 4 V between the cooling fan circuit terminal 9 and ground.

- **If less than 3 V**

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Test for infinite resistance between the cooling fan circuit and ground.
 - If less than infinite resistance, repair the short to ground on the circuit.
 - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , replace the K20 Engine Control Module.

- **If 4V or greater**

1. Vehicle OFF. Disconnect the X1 harness connector at the K20 Engine Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the cooling fan circuit and ground.
 - If greater than 1 V, repair the short to voltage on the circuit.
 - If 1 V or less, replace the K20 Engine Control Module.

- **If 3 - 4 V**

3. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
4. Reconnect the K114B Hybrid/EV Powertrain Control Module 2 connector X2.
5. Vehicle in Service Mode. Test for greater than 10 V between the signal circuit and ground.

- **If 10 V or less**

Replace the Hybrid/EV Powertrain Control Module 2.

- **If greater than 10 V**

6. Replace the K20 Engine Control Module.

DTC P2181: ENGINE COOLING SYSTEM PERFORMANCE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

DTC P2181

Engine Cooling System Performance

Circuit/System Description

The engine control module (ECM) monitors temperature difference between the engine coolant temperature (ECT) sensor and the radiator coolant temperature (RCT) sensor during a cold start-up. The purpose of this diagnostic is to analyze the engine coolant thermostat for being stuck open.

Conditions for Running the DTC

- DTCs P00B3, P00B4, P00B6, P0101, P0102, P0103, P0111, P0112, P0113, P0114, P0116, P0117 or P0118 are not set.
- The vehicle has had a minimum ignition OFF time of 7 h.
- The engine run time is between 50 s and 23 min.
- The engine coolant temperature (ECT) sensor at start-up is between -10°C and 59°C (14°F and 138°F).
- The intake air temperature (IAT) sensor is between -7°C and 60°C (19°F and 140°F).
- The Engine Coolant Thermostat Heater Command is less than 50 %.
- The Ethanol in the fuel is less than 87 %.
- The airflow into the engine is between 1 and 100 g/s.
- The DTC runs once per ignition cycle when the above conditions are met.

Conditions for Setting the DTC

The ECM detects the engine coolant thermostat is stuck open for at least 2.5 min.

Action Taken When the DTC Sets

DTC P2181 is a Type B DTC

Conditions for Clearing the DTC

DTC P2181 is a Type B DTC

Diagnostic Aids

- Insufficient vehicle interior heating is an indication of improper thermostat operation.
- The scan tool Desired ECT Sensor and the ECT Sensor parameters should be within 5°C (41°F) when the engine is at operating temperature.
- A resistance condition in the ECT sensor circuits may cause this DTC. This condition results in a greater voltage on the ECT sensor signal circuit, which is interpreted by the ECM as a colder ECT.

Circuit/System Verification

1. Engine Running.
2. Verify DTC P00B3, P00B4, P00B6, P0116, P0117, P0118, or P0119 is not set.
 - **If the DTC is set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.
 - **If the DTC is not set**
3. Verify the coolant in the radiator surge tank is at the correct level and there are no engine coolant leaks.
 - **If a condition is found**

Refer to [Cooling System Draining and Filling](#), and [Loss of Coolant](#).
 - **If a condition is not found**
4. Engine Running for 15 min with the A/C OFF.
5. Command the Engine Coolant Thermostat Heater to 0 % with a scan tool, depress the accelerator pedal for 5 min.
6. Verify the scan tool ECT Sensor parameter is between 80Â° C and 102Â° C (176Â° F and 215Â° F).
 - **If ECT sensor parameter is not between 80Â° C and 102Â° C (176Â° F and 215Â° F)**

Replace the engine coolant thermostat.
 - **If ECT sensor parameter is between 80Â° C and 102Â° C (176Â° F and 215Â° F)**
7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
8. Verify the DTC does not set.

- **If the DTC sets**

Refer to step 1.

- **If the DTC does not set**

9. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

[Engine Coolant Thermostat Housing Replacement](#) for engine coolant thermostat replacement.

SYMPTOMS - ENGINE COOLING

Important Preliminary Inspections Before Starting

Before using the Symptom diagnosis, perform the following:

- Perform [Diagnostic System Check - Vehicle](#) and verify all of the following items:
 - Ensure that the engine control module (ECM) and indicator lamp are operating correctly.
 - Ensure that there are no diagnostic trouble codes (DTCs) that are stored.
 - Scan tool data is within a normal operating range.
- Verify the customer concern.
- Perform the Visual/Physical Inspection in this section. The visual/physical inspection is extremely important, and can lead to correcting a condition without additional testing. It may also help reveal the cause of an intermittent condition.
- Locate the correct symptom. Perform the tests and inspections associated with the symptom.

Review the entire cooling system operation in order to familiarize yourself with the system functions. Refer to [Cooling System Description and Operation](#), and [Hybrid/EV Cooling System Description and Operation](#).

Visual/Physical Inspection

CAUTION: Use the connector test adapter kit EL-35616-F for any test that requires probing the following items:

- **The control module harness connectors**
- **The electrical center fuse/relay cavities**
- **The component terminals**
- **The component harness connector**

Using this kit will prevent damage caused by the improper probing of connector terminals.

Several of the symptom procedures call for a careful visual and physical inspection. This can lead to correcting a condition without further tests and can save time. This inspection should include the following areas:

- Ensure that all control module grounds are clean, tight, and correctly located.

- Inspect cooling system hoses and pipes for splits, kinks, and proper connections. Inspect thoroughly for any type of a leak or a restriction.
- Inspect for a dirty or restricted engine cooling radiator and HVAC condenser.
- Inspect for aftermarket devices which could affect the operation of the Cooling System.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the surge tank reservoirs for the proper coolant level.

Identifying Intermittent Conditions

Many intermittent conditions occur with harness or connector movement due to engine torque, rough pavement, vibration or physical movement of a component. Refer to the following for a list to help isolate an intermittent condition:

- Moisture and water intrusion in connectors, terminals, and components
- Connector mating
- Terminal contact
- High circuit or component resistance - High resistance can include any resistance, regardless of the amount, which can interrupt the operation of the component.
- Harness' that are routed too tight, or chaffed circuits
- High or low ambient temperature
- High or low engine coolant temperatures
- High underhood temperatures
- Heat build up in component or circuit due to circuit resistance, poor terminal contact, or high electrical load
- High or low system voltage
- High vehicle load conditions
- Rough road surface
- Electro-magnetic interference (EMI)/circuit interference from relays, solenoids or other electrical surge
- Incorrect installation of non-factory, aftermarket, and after factory add on accessories

If an intermittent is detected, refer to [**Testing for Intermittent Conditions and Poor Connections**](#) for specific strategies in diagnosing intermittent conditions.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- [**DTC P148A-P148C**](#)
- [**Engine Overheating**](#)
- [**Loss of Coolant**](#)
- [**Thermostat Diagnosis**](#)
- [**Engine Fails To Reach Normal Operating Temperature**](#)

COOLING FAN INOPERATIVE

Diagnostic Instructions

- Perform the [Diagnostic System Check - Vehicle](#) prior to using this diagnostic procedure.
- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

Circuit/System Description

The engine cooling fan system is composed of one electric cooling fan and a cooling fan control module. The engine control module (ECM) controls the fan speed by sending a pulse width modulated (PWM) signal to the cooling fan control module. The cooling fan control module varies the voltage drop across the cooling fan motor in relation to the pulse width modulated signal, which enables cooling fan operation at variable speeds. The ECM will only operate the cooling fan at certain percentages to prevent undesirable noise and vibration. The cooling fan control module is thermally protected to prevent module damage in the case of a short circuit condition in the cooling fan motor.

Diagnostic Aids

- The cooling fan will not operate when the scan tool Cooling Fan Motor Command parameter displays less than 4 %. This is a normal condition.
- A delay or ramp up of approximately 12 seconds may occur before the cooling fan activates or changes speed when being commanded with a scan tool.
- The cooling fan Control Function operates as described below when the ignition is ON, and engine is OFF:
 - Command State 1 operates the cooling fan at approximately 18 %
 - Command State 2 operates the cooling fan at approximately 54 %
 - Command State 3 operates the cooling fan at approximately 67 %
 - Command State 4 operates the cooling fan at approximately 85 %
 - Command State 5 operates the cooling fan at approximately 90 %
- During normal operating conditions the ECM may initially activate the cooling fan at 4 or 5 % and then increase to the percentages indicated above, as needed, to satisfy powertrain cooling requirements. Generally, the ECM will operate the cooling fan at the specified percentages but, may scale the percentages either higher or lower in response to generator demand.
- When operating the cooling fan with a scan tool, the Commanded States 1 - 5 should be exercised in order, from OFF to High or High to OFF. The cooling fan control module may disable the cooling fan if a Commanded State is skipped.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC P01485 - P1487

- **If a DTC is set**

Refer to **DTC P1485-P1487**.

- **If no DTC is set.**

NOTE: A slight delay may occur before the cooling fan activates.

3. Verify the G10 Cooling Fan Motor activates and increases in speed with each command using a scan tool.
- **The cooling fan does not activate or increase in speed**

Refer to Circuit/System Testing

- **The cooling fan activates and increases in speed**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector G10 Cooling Fan Motor.
2. Verify that a test lamp illuminates between the ground circuit terminal 2 and B+.
 - **If the test lamp does not illuminate**
 1. Ignition OFF, and all vehicle systems OFF, it may take up to 2 minutes for all vehicle systems to power down.
 2. Test for less than 2 Ω in the ground circuit end to end.
 - If 2 Ω or greater, repair the open/high resistance in the circuit.
 - If less than 2 Ω , repair the open/high resistance in the ground connection.
 - **If the test lamp illuminates**
3. Test or replace the G10 Cooling Fan Motor.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the diagnostic procedure.

- [Engine Coolant Fan Shroud Replacement](#) for G10 Cooling Fan Motor replacement.

ENGINE OVERHEATING

Step	Action	Yes	No
DEFINITION: The engine temperature lamp comes on and stays on, or temperature gauge shows hot, or coolant overflows from the coolant recovery reservoir onto the ground while the engine is running. Special Tools GE-26568 Coolant and Battery Fluid Tester Equivalent regional tools: Special Tools			
1	Check the condenser, radiator, and auxiliary coolers for any obstructions or bent fins that would prevent air flow through the radiator. Is there any airflow obstruction or bent fins?	Go to Step 2	Go to Step 3
2	1. Remove any debris that may cause an air flow obstruction. 2. Remove or relocate aftermarket add-on components that block air flow to the radiator. Does the engine still overheat?	Go to Step 3	System OK
3	Check for loose, missing, or damaged radiator air seals or deflectors. Are there any loose, missing, or damaged radiator air seals or deflectors?	Go to Step 4	Go to Step 5
4	Repair or replace any loose, missing, or damaged radiator air seals or deflectors. Does the engine still overheat?	Go to Step 5	System OK
5	Check for an inoperative cooling fan. Is the cooling fan inoperative?	Go to Step 6	Go to Step 7
6	Repair or replace the cooling fan(s) as necessary. Refer to Engine Coolant Fan Shroud Replacement . Does the engine still overheat?	Go to Step 7	System OK
7	Check for a loss of coolant. Refer to Loss of Coolant . Does the engine still overheat?	Go to Step 8	System OK
8	Check for kinked or pinched cooling hoses. Does the engine still overheat?	Go to Step 9	Go to Step 10
9	1. Relieve any kinks by rerouting the hoses. 2. Replace the hoses, if necessary. Does the engine still overheat?	Go to Step 10	System OK

Step	Action	Yes	No
10	Using GE-26568 Coolant and Battery Fluid Tester, check the coolant concentration. Does the coolant concentration test correctly?	Go to Step 12	Go to Step 11
11	Replace the coolant, if necessary. Refer to Cooling System Draining and Filling . Does the engine still overheat?	Go to Step 12	System OK
12	Check for any blocked cooling system passages. Are there blocked cooling system passages?	Go to Step 13	Go to Step 14
13	Remove any obstructions by flushing the cooling system. Refer to Flushing . Does the engine still overheat?	Go to Step 14	Go to Step 19
14	Inspect the water pump drive belt. Does the engine still overheat?	Go to Step 15	System OK
15	Check for a faulty thermostat. Refer to Thermostat Diagnosis . Does the engine still overheat?	Go to Step 16	System OK
16	Replace the radiator. Refer to Radiator Replacement . Does the engine still overheat?	Go to Step 17	System OK
17	Check for a faulty water pump. The impeller blades may be eroded or broken. Is the water pump faulty?	Go to Step 18	-
18	Replace the water pump. Refer to Water Pump Replacement . Does the engine still overheat?	Go to Step 19	-
19	Operate the system to verify the repair. Did you correct the condition?	System OK	-

LOSS OF COOLANT

Step	Action	Yes	No
DEFINITION: The cooling system is losing coolant either internally or externally.			
1	Were you sent here from Symptoms or another diagnostic table?	Go to Step 2	Go to Symptoms - Engine Cooling
2	Repair any present DTCs. Refer to Diagnostic System Check - Vehicle . Is the action complete?	Go to Step 3	-
3	Inspect the coolant level. Is the coolant at the proper level?	Go to Step 5	Go to Step 4
4	Fill the cooling system to the proper level. Refer to Cooling System Draining and Filling . Is the action complete?	Go to Step 5	-
5	If the engine is suspected to have a coolant leak into a cylinder, the coolant can hydraulically lock the engine. Does the engine crankshaft rotate?	Go to Step 6	Go to Step 27

Step	Action	Yes	No
6	Engine overheating can cause a loss of coolant. Is the engine overheating?	Go to Step 28	Go to Step 7
7	Extended operation with a low coolant level can cause engine internal component failure. Is the engine knocking?	Go to Step 30	Go to Step 8
8	1. Idle the engine at normal operating temperature. 2. Inspect for heavy white smoke coming out of the exhaust pipe. Is a heavy white smoke present from the exhaust pipe?	Go to Step 9	Go to Step 10
9	Coolant in the exhaust system creates a distinctive, burning coolant odor in the exhaust. Condensation in the exhaust system can cause an odorless white smoke during engine warm up. Does the white smoke have a burning coolant type odor?	Go to Step 29	Go to Step 10
10	WARNING: Refer to <u>Moving Parts and Hot Surfaces Warning</u> . With the engine idling, inspect the coolant recovery system. Does the coolant recovery system discharge coolant while the engine is idling?	Go to Step 15	Go to Step 11
11	Visually inspect the hoses, pipes and hose clamps at the following locations: • The coolant surge tank • The heater core • The radiator Are any of the hoses, clamps or pipes leaking?	Go to Step 21	Go to Step 12
12	Visually inspect the following components: • The coolant pressure cap • The core plugs • The cylinder head gaskets • The engine block • The intake manifold • The radiator • The thermostat housing	Go to Step 21	Go to Step 13

Step	Action	Yes	No
	The water pump Are any of the listed components leaking?		
13	1. Pressure test the cooling system. Refer to Cooling System Leak Testing. 2. With the cooling system pressurized, visually inspect the components listed in steps 11 and 12. Are any leaks present?	Go to Step 21	Go to Step 14
14	Pressure test the coolant pressure cap. Does the coolant pressure cap hold pressure?	Go to Step 16	Go to Step 22
15	Pressure test the coolant pressure cap. Does the coolant pressure cap hold pressure?	Go to Step 31	Go to Step 22
16	Inspect for the following conditions: - A coolant smell inside of the vehicle - Coolant in the HVAC module drain tube - Coolant on the vehicle floor covering near the HVAC module Is coolant present?	Go to Step 23	Go to Step 17
17	Check the carbon dioxide in the cooling water. Refer to Cooling System Leak Testing. Are any leaks present?	Go to Step 29	Go to Step 18
18	Inspect the underside of the engine oil fill cap for a gray/white milky substance. Is a milky substance under the oil fill cap?	Go to Step 19	Go to Step 20
19	Inspect the engine oil fluid level indicator for a gray/white milky substance. Is a milky substance on the engine oil fluid level indicator?	Go to Step 29	Go to Step 20
20	Inspect the automatic transmission oil fluid level indicator, if equipped, for a gray/white milky substance. Is there a milky substance on the automatic transmission fluid level indicator?	Go to Step 24	Go to Step 32
21	Repair or replace the leaking component. Refer to the appropriate repair. Is the repair complete?	Go to Step 32	-
22	Replace the coolant pressure cap. Is the repair complete?	Go to Step 32	-

Step	Action	Yes	No
23	Replace the heater core. Refer to Heater Core Replacement . Is the repair complete?	Go to Step 32	-
24	1. Remove the transmission oil cooler lines from the radiator. 2. Pressure test the cooling system. Refer to Cooling System Leak Testing . 3. Inspect the transmission oil cooler for coolant. Is coolant present?	Go to Step 25	Go to Step 26
25	1. Replace the radiator. Refer to Radiator Replacement . 2. Service the automatic transmission. Is the repair complete?	Go to Step 32	-
26	Install the cooler lines to the radiator. Is the action complete?	Go to Step 32	-
27	Repair the engine no crank condition. Is the repair complete?	Go to Step 32	-
28	Repair the engine overheating condition. Is the repair complete?	Go to Step 32	-
29	Repair the engine internal coolant leak. Is the repair complete?	Go to Step 32	-
30	Repair the engine knock. Is the repair complete?	Go to Step 32	-
31	Repair the combustion pressure in the cooling system problem. Is the repair complete?	Go to Step 32	-
32	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

THERMOSTAT DIAGNOSIS

Step	Action	Values	Yes	No
The Procedure is ONLY valid for a mechanical opening without a electrical heating.				
1	1. Pressure test the cooling system and the cap for leaks. 2. Repair any leaks before proceeding. These engines use a 97Â°C (207Â°F) thermostat. The ambient temperatures should be within the specified range given. 3. Set the HVAC controls in the OFF position.	13 - 38Â°C (55 - 100Â°F)	System OK	Go to Step 2

Step	Action	Values	Yes	No
	4. Run the cold engine at idle 20Â°C - 21Â°C (68 - 70Â°F) for 15-20 minutes before checking the engine temperature. 5. Check the engine coolant temperature at idle with the scan tool. Is the engine coolant temperature (ECT) between 97 - 112Â°C (207 - 234Â°F)?			
2	Is the ECT below 97Â°C (207Â°F)?	-	Go to Step 3	Go to Step 4
3	The thermostat is opening early, or the thermostat seal is leaking. Replace the thermostat and the thermostat seal. Is the repair complete?	-	System OK	-
4	Is the ECT over 112Â°C (234Â°F)?	-	Go to Step 5	-
5	Is the radiator inlet hot?	-	Go to Step 6	Go to Step 7
6	1. Turn ON the heater. 2. Check if hot air is coming from the heater outlets. Is the air hot?	-	Go to Step 11	Go to Step 12
7	There may be air in the system. 1. Add coolant to the surge tank if the coolant level is low. Refer to Cooling System Draining and Filling. 2. Recheck the radiator inlet hose. Is the inlet hose hot?	-	Go to Step 6	Go to Step 8
8	Inspect for blockage in the following areas: • The cylinder head • The radiator • The radiator hoses Is there a blockage?	-	Go to Step 9	Go to Step 10
9	1. Repair the blockage. 2. Recheck the coolant temperature with the scan tool. Is the repair complete?	-	System OK	-
10	1. Replace the thermostat housing. Refer to Engine Coolant Thermostat Housing	-	System OK	-

Step	Action	Values	Yes	No
	<u>Replacement.</u> 2. Recheck the coolant temperature with the scan tool. Is the repair complete?			
11	Inspect for blockage in the radiator. Is there any blockage?	-	Go to Step 9	Go to Step 10
12	1. Accelerate the engine several times in order to remove any air from the system. 2. Inspect for blockage in the heater circuit. 3. Inspect for any pinched or buckled hoses. Is there any blockage?	-	Go to Step 9	Go to Step 13
13	Is the repair complete?	Å	System OK	-

ELECTRICALLY HEATED THERMOSTAT DIAGNOSIS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Circuit/System Description

The engine cooling system electrically heated thermostat is an integrated part of the thermostat housing. It is not serviced separately. The thermostat contains a wax pellet which expands when electrically energized. The ECM energizes the wax pellet during full load driving, or, when the engine coolant or the ambient temperature is higher. This causes the thermostat to open earlier than it would without electrical assistance.

During normal engine operation, the thermostat begins to open mechanically at 78Å° C (172Å° F). When coolant temperature reaches or exceeds 80Å° C (176Å° F), the ECM begins to energize the wax pellet to try to maintain coolant temperature at 78Å° C (172Å° F).

Diagnostic Aids

- A radiator or AC condenser with bent fins or obstructed air flow passages may cause the engine coolant temperature to be too hot.
- An incorrect engine coolant mixture may cause the engine coolant to boil at low temperature.
- An engine coolant mixture that is contaminated with debris may adversely affect the operation of the cooling system components. Verify that the coolant mixture is not contaminated.
- An engine cooling system that has been incorrectly filled or serviced may have air trapped within the system. If the system contains air, the coolant level may appear to be correct while it is actually incorrect. To avoid misdiagnosis, it may be necessary to verify that no conditions have occurred that may cause the cooling system to contain trapped air.
- For accurate test results, allow the vehicle to stabilize in an environment where ambient temperature is

between 10 - 27Â° C (50 - 80Â° F) for 8 hours prior to testing.

Circuit/System Verification

1. Ignition ON/ Vehicle in Service Mode.
2. Verify that DTC P00B3, P00B4, P00B6, P00B7, P0116, P0117, P0018, P0119, P0128, P0597, P0598, P0599, or P2181 is not set.
 - **If DTC P00B3, P00B4, P00B6, P00B7, P0116, P0117, P0018, P0119, P0128, P0597, P0598, P0599, or P2181 is set.**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#) for further diagnosis.

- **If DTC P00B3, P00B4, P00B6, P00B7, P0116, P0117, P0018, P0119, P0128, P0597, P0598, P0599, or P2181 is not set.**
3. Verify the coolant reservoir contains the correct level of engine coolant.
 - **If the coolant level is low**

Fill the coolant reservoir to the correct level and pressure test the cooling system and the coolant reservoir cap for a leak. Refer to [Cooling System Draining and Filling](#), and [Cooling System Leak Testing](#). If a leak is found, repair as necessary.
 - **If the coolant level is not low**
 4. Verify the G10 Cooling Fan Motor activates in each available speed when commanding the cooling fan

ON with a scan tool. The cooling fan speed should increase with each command.

- **If the cooling fan does not activate or increase in speed as commanded**

Refer to [Cooling Fan Inoperative](#)

- **If the cooling fan activates and increases in speed as commanded**

5. Close the hood and set the HVAC controls to the OFF position.
6. Start the engine and warm the engine up to operating temperature.
7. Verify the scan tool ECT Sensor parameter displays between 101 - 120Â° C (214 - 248Â° F) while the engine is running.

- **If 121Â° C (249Â° F) or greater**

Refer to Circuit/System Testing - Engine Coolant Temperature too High.

- **If 90Â° C (194Â° F) or less.**

Refer to Circuit/System Testing - Engine Coolant Temperature too Low.

- **If between 101 - 120Â° C (214 - 248Â° F).**

8. All OK.

Circuit/System Testing

NOTE: For accurate test results, allow the vehicle to stabilize in an environment where ambient temperature is between 10 - 27Â° C (50 - 80Â° F) for 8 hours prior to testing.

Engine Coolant Temperature too High

1. Start the engine and verify the HVAC controls are set to the OFF position.

NOTE: The cooling fan should automatically turn ON when you select Engine Coolant Thermostat Heater.

2. With the scan tool, navigate to Control Functions and select Engine Coolant Thermostat Heater and Cooling Fan. Verify the engine cooling fan turns ON when Engine Coolant Thermostat is selected.
3. Verify the hood is closed.
4. Engine running at 1, 600 RPM, note or record the ECT Sensor parameter value.

NOTE:

- An engine cooling system that has been incorrectly filled or serviced may have air trapped within the system. If the system contains air, the coolant level may appear to be correct while it is actually incorrect. For accurate test results, it may be necessary to verify that no conditions have occurred that may cause the system to contain trapped air.
- Depending on ambient temperature, it may take up to 4 minutes for the temperature to decrease 10Â°C (18Â°F) or greater.

- The ECT Sensor parameter value may increase between 3 - 5°C (2 - 9°F) at first. It should then decrease 10°C (18°F) or greater and stabilize.

5. Engine at 2,000 RPM, verify the ECT Sensor parameter decreases by 10°C (18°F) or greater while commanding the scan tool Engine Coolant Thermostat Heater to 100 %.

- If the parameter does not decrease by 10°C (18°F) or greater

Inspect for the conditions listed below and repair as necessary. Refer to [Symptoms - Engine Cooling](#) for additional information.

- Restricted/plugged radiator
- Restricted/plugged radiator hoses
- Restricted/plugged cylinder head
- Restricted/plugged heater core or heater hoses
 - If none of the conditions listed above exist, replace the E41 Engine Coolant Thermostat.

NOTE: If the thermostat is intermittently sticking closed, it may be necessary to repeat the Circuit/System Verification and Circuit/System Testing.

- If the parameter decreases by 10°C (18°F) or greater

6. All OK.

Engine Coolant Temperature too Low

NOTE: For accurate test results, allow the vehicle to stabilize in an environment where ambient temperature is between 10 - 27°C (50 - 80°F) for 8 hours prior to testing.

NOTE: Information for the following test may be in GDS stored data from the Circuit/System Verification.

1. Verify the hood is closed.
2. Start the engine and set the HVAC controls to the OFF position.
3. Engine idling, verify the scan tool ECT Sensor parameter reaches between 90 - 100°C (194 - 212°F) within the guidelines listed below:
 - At 27°C (80°F) ambient temperature, the parameter should reach 85°C (185°F) in 18 minutes or less.
 - At 20°C (68°F) ambient temperature, the parameter should reach 85°C (185°F) in 22 minutes or less.
 - At 10°C (50°F) ambient temperature, the parameter should reach 85°C (185°F) in 26 minutes or less.
 - If the parameter does not display 85°C (185°F) within the guidelines listed above

Replace the E41 Engine Coolant Thermostat.

- If the parameter displays between 85Â° C (185Â° F) within the guidelines listed above

4. All OK.

Repair Instructions

Perform the [Diagnostic Repair Verification](#) after completing the repair.

Engine Coolant Thermostat Housing Replacement

ENGINE FAILS TO REACH NORMAL OPERATING TEMPERATURE

Step	Action	Yes	No
1	Check the coolant level in the radiator surge tank. Refer to Cooling System Draining and Filling . Is the coolant at the proper level?	Go to Step 3	Go to Step 2
2	Add coolant to the radiator surge tank as necessary. Does the engine still fail to reach normal operating temperatures?	Go to Step 3	System OK
3	Check for a blockage in the coolant passages. Are there any blockages in the coolant passages?	Go to Step 4	Go to Step 5
4	Flush the cooling system or flow check the radiator. Does the engine still fail to reach normal operating temperatures?	Go to Step 5	System OK
5	Check to see if the incorrect thermostat was installed or if it is stuck or sticks in the open position. Was the incorrect thermostat installed, or is it stuck or does it stick in the open position?	Go to Step 6	-
6	Replace the thermostat. Refer to Engine Coolant Thermostat Housing Replacement . Does the engine still fail to reach normal operating temperature?	-	System OK

PRESSURE CAP TESTING

Special Tools

- GE-42401-A Radiator Cap and Surge Tank Test Adapter
- EN-24460-A Cooling System Pressure Tester

Equivalent regional tools:[Special Tools](#)

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. Remove the pressure cap.
2. Wash the pressure cap sealing surface with water.

Fig. 2: Identifying Pressure Cap Tester

Courtesy of GENERAL MOTORS COMPANY

NOTE: Lubricate GE-42401-A radiator cap and surge tank test adapter and pressure cap O-rings with coolant and press cap to seat O-ring on GE-42401-A radiator cap and surge tank test adapter before turning to engage threads.

3. Use the **EN-24460-A** cooling system pressure tester (1) with **GE-42401-A** radiator cap and surge tank test adapter (2) in order to test the pressure cap.
4. Test the pressure cap for the following conditions:
 - Pressure release when the **EN-24460-A** cooling system pressure tester exceeds the pressure rating of the pressure cap.
 - Maintain the rated pressure for at least 10 seconds.Note the rate of pressure loss.
5. Replace the pressure cap under the following conditions:
 - The pressure cap does not release pressure which exceeds the rated pressure of the cap.
 - The pressure cap does not hold the rated pressure.

COOLING SYSTEM LEAK TESTING

Special Tools

GE-42401-A Radiator Cap and Surge Tank Test Adapter

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Under pressure, the temperature of the solution in the radiator can be considerably higher, without boiling. Removing the radiator cap while the engine is hot (pressure is high), will cause the solution to boil instantaneously, with explosive force. The solution will spew out over the engine, fenders, and the person removing the cap. Serious bodily injury may result. Flammable antifreeze, such as alcohol, is not recommended for use at any time. Flammable antifreeze could cause a serious fire.

WARNING: In order to help avoid being burned, do not remove the radiator cap while the engine and the radiator are hot. Scalding fluid and steam can be blown out under pressure if the cap is removed too soon.

1. Remove the pressure cap.
2. Test the operation of the pressure cap. Refer to [Pressure Cap Testing](#).
3. Wash the pressure cap mating surface with water.

Fig. 3: J-42401-2 Pressure Test Adapter And Coolant Recovery Reservoir
Courtesy of GENERAL MOTORS COMPANY

4. Install the **GE-42401-2** pressure test adapter (1) to the coolant recovery reservoir (2) to plug the reservoir bleeder gallery.

Fig. 4: Cooling System Pressure Adapter

Courtesy of GENERAL MOTORS COMPANY

5. Use a commercial cooling system pressure adapter (1) and moisten the rubber with coolant fluid.

Fig. 5: Commercial Adapter And Adapter

Courtesy of GENERAL MOTORS COMPANY

6. Install the commercial adapter (1) to the **GE-42401-3** adapter (2). Use a suitable underlay to be able to use enough force. Inspect the assembly for proper seat then.

Fig. 6: Commercial Cooling System Pressure Tester, Assembled Adapters and Coolant Recovery Reservoir

Courtesy of GENERAL MOTORS COMPANY

7. Install the assembled adapters (3, 4) to the coolant recovery reservoir (5).
8. Install a commercial cooling system pressure tester (1, 2) to the commercial adapter.

NOTE: Do NOT exceed the pressure cap rating.

9. Using the pressure tester apply pressure to the cooling system.
10. Observe the gage of the pressure tester for any loss.
11. The cooling system should hold the rated pressure for at least 2 minutes.
12. Repair any leaks as required.

REPAIR INSTRUCTIONS

HOSE CLAMP REPLACEMENT GUIDELINES - SPRING TYPE

Special Tools

- **BO-38185** Hose Clamp Pliers
- **GE-47622** Hose Clamp Pliers.

Equivalent regional tools: [Special Tools](#)

Spring Type Hose Clamp Replacement Guidelines

Fig. 7: Spring Type Hose Clamps

Courtesy of **GENERAL MOTORS COMPANY**

Vehicles utilize spring type hose clamps (1) to secure joints in which fluids, gases, or engine vacuum can travel to various vehicle systems. Spring type hose clamps are engineered to provide the proper amount of tension to maintain a leak & maintenance free joint for the life of the vehicle.

Spring type hose clamps have a special coating applied to the exterior of the clamp that is engineered to resist rust/corrosion, improve durability and increase the life of the hose clamp. If the coating is damaged, rust/corrosion could form resulting in the need to replace the hose clamp.

Many spring type hose clamps within GM utilize a small amount of adhesive placed directly on the hose clamp to secure the clamp to the mating hose for manufacturing purposes. Over time the strength of the adhesive will deteriorate. It is extremely important when a technician is attempting to service a joint or remove the hose clamp, that the clamp is not rotated or repositioned so that it tears and/or damages the hose. In this case, the hose and clamp must both be replaced.

When repairing a vehicle it is very important to observe the condition of both the hose and the spring type hose clamp as well as the orientation of the clamp to the hose.

If the spring type hose clamp(s) have any of the following conditions on any area of the clamp, replace the

clamp(s) immediately.

- Rust/Corrosion
- Cracks
- Physical damage
- Leakage attributed to the retention of the clamp

Removing The Spring Type Hose Clamp

While keeping the hose stationary, use BO-38185 Hose Clamp Pliers or GE-47622 Hose Clamp Pliers and release the spring type hose clamp tension while attempting to separate the hose clamp from the hose.

- If the spring type hose clamp will not easily separate from the hose and/or the clamp tears or damages the hose, both the hose and hose clamp must be replaced
- If the spring type hose clamp is easily removed from the hose, the clamp can be reused provided that the clamp does not have any of the conditions as noted above.

If The Spring Type Hose Clamp Is Being Reused

It is extremely important that the spring type hose clamp is orientated to the hose in the exact same position as it was installed during vehicle assembly so that the hose clamp is not damaged or the hose clamp does not contact or damage any adjacent components. Do not use any type of adhesive on the hose clamp prior to installation.

When Reusing The Spring Type Hose Clamp and Replacing The Hose

- The inside and outside hose diameter must be identical between the new hose and the existing hose to guarantee proper hose clamp tension and joint integrity.
- Always place the existing spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The new hose might have a marking on the hose indicating the correct position of a hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

When Reusing The Spring Type Hose Clamp with an Existing Hose

Always place the existing spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The existing hose might have an indentation or compression mark on the hose from where the hose clamp was installed previously. The hose clamp should identically overlay this position. The existing hose might also have a marking on the hose indicating the correct position of the hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

If The Spring Type Hose Clamp Is Being Replaced

If the hose clamp needs to be replaced, always replace the hose as part of the service repair. It is extremely important that a new spring type hose clamp is orientated to the hose in the exact same position as it was installed during vehicle assembly so that the hose clamp is not damaged or the hose clamp does not contact or damage any adjacent components. Do not use any type of adhesive on the hose clamp prior to installation.

When Replacing The Spring Type Hose Clamp and Replacing The Hose

- The inside and outside hose diameter must be identical between the new hose and the existing hose to guarantee proper hose clamp tension and joint integrity.
- Always place the new spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The new hose might have a marking on the hose indicating the correct position of a hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

When Replacing The Spring Type Hose Clamp with an Existing Hose

Always place the new spring type hose clamp in the same orientation as it was positioned prior to separating the joint. The existing hose might have an indentation or compression mark on the hose from where a hose clamp was installed previously. The hose clamp should identically overlay this position. The existing hose might also have a marking on the hose indicating the correct position of the hose clamp, which should re-confirm the correct hose clamp position. The hose clamp should not contact any adjacent components after installation.

COOLING SYSTEM DRAINING AND FILLING

Special Tools

- **GE-26568** Coolant and Battery Tester
- **GE-47716** Vac-N-Fill Coolant Refill Tool
- **GE-42401-A** Radiator Cap and Surge Tank Test Adapter

Equivalent regional tools: [Special Tools](#)

Draining Procedure

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

1. To drain the engine radiator, remove the radiator drain cock from the radiator. Refer to [Radiator Drain Cock Replacement](#).

Fig. 8: View Of Venturi Assembly & Vacuum Tank
Courtesy of GENERAL MOTORS COMPANY

2. Attach the venturi assembly to the vacuum tank.

Fig. 9: View Of Shop Air Hose & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Attach a shop air hose to the venturi assembly.

Ensure the valve on the venturi assembly is closed.

4. Attach the vacuum hose to the vacuum tank.

Fig. 10: Attaching Extraction Hose To Vacuum Hose

Courtesy of GENERAL MOTORS COMPANY

5. Attach the extraction hose to the vacuum hose.
6. Insert the extraction hose into the radiator outlet front hose until the extraction hose contacts the bottom of the radiator outlet hose.

Fig. 11: Identifying Valve On Venturi Assembly

Courtesy of GENERAL MOTORS COMPANY

7. Open the valve on the venturi assembly to start a vacuum draw.
8. Use the extraction hose to draw out coolant until the radiator is empty.
9. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.
10. If a complete engine block drain is required, remove the engine block drain plug.
11. To drain the heater cooling loop, remove the heater inlet hose from the heater cooling heater. Refer to [Heater Inlet Hose Replacement](#) .
12. Inspect the coolant.
13. Follow the appropriate procedure based on the condition of the coolant.
 - Normal in appearance--Follow the filling procedure.
 - Discolored--Follow the flush procedure. Refer to [Flushing](#)
14. After draining the system:
 1. Install [Radiator Drain Cock Replacement](#)
 2. Install [Heater Inlet Hose Replacement](#)

Vac-N-Fill Procedure

WARNING: To avoid being burned, do not remove the radiator cap or surge tank cap while the engine is hot. The cooling system will release scalding fluid and steam under pressure if radiator cap or surge tank cap is removed while the engine and radiator are still hot.

NOTE: To prevent boiling of the coolant/water mixture in the vehicles cooling system, do not apply vacuum to a cooling system above 49°C (120°F). The tool will not operate properly when the coolant is boiling.

Fig. 12: Identifying Vac-N-Fill Cap

Courtesy of GENERAL MOTORS COMPANY

1. Install **GE-42401-2** Radiator Cap and Surge Tank Test Adapter into the surge tank fill neck.
2. Install **GE-42401-3** Radiator Cap and Surge Tank Test Adapter to the surge tank fill neck.
3. Attach the Vac N Fill cap to the **GE-42401-3** Radiator Cap and Surge Tank Test Adapter.

Fig. 13: Attaching The Vacuum Gage Assembly To The Vac-N-Fill Cap
Courtesy of GENERAL MOTORS COMPANY

4. Attach the vacuum gauge assembly to the Vac N Fill cap.

Fig. 14: Attaching Fill Hose To Barb Fitting On Vacuum Gage Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Attach the fill hose to the barb fitting on the vacuum gauge assembly.

Ensure that the valve is closed.

Fig. 15: View Of Graduated Reservoir & Hose
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a 50/50 mixture of DEX-COOL antifreeze and de-ionized water.

Always use more coolant than necessary. This will eliminate air from being drawn into the cooling system.

6. Pour the coolant mixture into the graduated reservoir.
7. Place the fill hose in the graduated reservoir.

NOTE: Prior to installing the vacuum tank onto the graduated reservoir, ensure that the drain valve located on the bottom of the tank is closed.

8. Install the vacuum tank on the graduated reservoir with the fill hose routed through the cut-out area in the vacuum tank.

Fig. 16: View Of Venturi Assembly & Vacuum Tank
Courtesy of GENERAL MOTORS COMPANY

9. Attach the venturi assembly to the vacuum tank.

Fig. 17: View Of Shop Air Hose & Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

10. Attach a shop air hose to the venturi assembly.

Ensure the valve on the venturi assembly is closed.

Fig. 18: Attaching Vacuum Hose To Vacuum Gauge Assembly & Vacuum Tank
Courtesy of GENERAL MOTORS COMPANY

11. Attach the vacuum hose to the vacuum gauge assembly and the vacuum tank.
12. Position the passenger compartment heater coolant control solenoid valve to normal using GDS. The hybrid powertrain control module 2 controls the passenger compartment heater coolant control solenoid Valve

Fig. 19: Identifying Valve On Venturi Assembly
Courtesy of GENERAL MOTORS COMPANY

13. Open the valve on the venturi assembly. The vacuum gauge will begin to rise and a hissing noise will be present.

Fig. 20: View Of Vacuum Gauge

Courtesy of GENERAL MOTORS COMPANY

14. Continue to draw vacuum until the needle stops rising. This should be 610-660 mm Hg (24-26 in Hg).

Cooling hoses may start to collapse. This is normal due to vacuum draw.

15. To aid in the fill process, position the graduated reservoir above the coolant fill port.

Fig. 21: Identifying Valve On Vacuum Gage Assembly

Courtesy of GENERAL MOTORS COMPANY

16. Slowly open the valve on the vacuum gauge assembly. When the coolant reaches the top of the fill hose, close the valve. This will eliminate air from the fill hose.
17. Close the valve on the venturi assembly.
18. If there is a suspected leak in the cooling system, allow the system to stabilize under vacuum and monitor for vacuum loss.

If vacuum loss is observed, refer to **Loss of Coolant**.

19. Open the valve on the vacuum gauge assembly. The vacuum gauge will drop as coolant is drawn into the system.

Fig. 22: View Of Vacuum Gauge & Radiator
Courtesy of GENERAL MOTORS COMPANY

20. Once the vacuum gauge reaches zero, close the valve on the vacuum gauge.
21. Repeat steps 14-21 twice.

Fig. 23: Attaching Extraction Hose To Vacuum Hose
Courtesy of GENERAL MOTORS COMPANY

22. Detach the Vac N Fill cap from the **GE-42401-3** Radiator Cap and Surge Tank Test Adapter.
23. Remove **GE-42401-2** Radiator Cap and Surge Tank Test Adapter from the surge tank fill neck.
24. Add coolant to the system as necessary.
25. Turn on the auxiliary coolant pump for 2 minutes using the GDS. The remote HVAC module controls the auxiliary coolant pump.
26. Start the engine.
27. Using GDS, increase the speed to 2000 rpm until the thermostat opens (approximately 100C).

NOTE: Do not allow engine coolant temperature to exceed 110C or damage to the Coolant Heater Control Module could occur.

28. Turn engine off.
29. Turn on the auxiliary coolant pump for 1 minute using GDS.
30. Turn off the auxiliary coolant pump and wait 5 minutes.
31. Repeat steps 24-30, three times.

32. Inspect the concentration of the coolant mixture using **GE-26568** Coolant and Battery Tester.

NOTE: After filling the cooling system, the extraction hose can be used to remove excess coolant to achieve the proper coolant level.

33. Detach the vacuum hose from the vacuum gauge assembly.

34. Attach the extraction hose to the vacuum hose.

Fig. 24: Identifying Valve On Venturi Assembly

Courtesy of GENERAL MOTORS COMPANY

35. Open the valve on the venturi assembly to start a vacuum draw.

Fig. 25: Using Extraction Hose To Draw Out Coolant
Courtesy of GENERAL MOTORS COMPANY

36. Use the extraction hose to draw out coolant to the proper level.
37. The vacuum tank has a drain valve on the bottom of the tank. Open the valve to drain coolant from the vacuum tank into a suitable container for disposal.

FLUSHING

NOTE:

- This procedure is intended for the engine cooling system only. Never use this procedure to flush the hybrid cooling system.
- When the cooling system becomes contaminated, the cooling system should be flushed thoroughly to remove the contaminants before the engine is seriously damaged.
- This procedure is effective in removing contaminants caused by the use of improper coolants, coolant at the end of its life, or some liquid chemical flushing agents. This procedure is NOT effective for removing debris contamination caused by component failure, or the use of 'stop leak' additives. When the system is contaminated by this type of debris, use the

system flow diagrams to identify components that may need replacement to restore proper system flow.

- Do not use chemical flush agents.
- Store used coolant in the proper manner, such as in a used engine coolant holding tank. Do not pour used coolant down a drain. Ethylene glycol antifreeze is a very toxic chemical. Do not dispose of coolant into the sewer system or ground water. This is illegal and ecologically unsound.
- Various methods and equipment can be used to flush the cooling system. If special equipment is used, such as a back flusher, follow the manufacturer's instruction. Always remove the thermostat before flushing the cooling system.

1. Drain the cooling system. [Cooling System Draining and Filling](#)
2. Remove [Radiator Surge Tank Replacement](#)
3. Clean and flush the coolant recovery reservoir with clean, drinkable water.
4. Install [Radiator Surge Tank Replacement](#)
5. Follow the drain and fill procedure using only clean, drinkable water. Refer to [Cooling System Draining and Filling](#).
6. Run the engine for 20 minutes.
7. Stop the engine.
8. Drain the cooling system. [Cooling System Draining and Filling](#)
9. Repeat the procedure if necessary, until the fluid is nearly colorless.
10. Fill the cooling system. [Cooling System Draining and Filling](#)

RADIATOR CLEANING

WARNING: NEVER spray water on a hot heat exchanger. The resulting steam could cause personal injury.

CAUTION: The heat exchanger fins are necessary for good heat transfer. Do not brush the fins. This may cause damage to the fins, reducing heat transfer.

NOTE: Remove bugs, leaves, dirt and other debris by blowing compressed air through the engine side of the radiator.

- Some conditions may require the use of warm water and a mild detergent.
- Clean the A/C condenser fins.
- Clean between the A/C condenser and radiator.
- Clean the radiator cooling fins.
- Straighten any damaged cooling fins.

WATER PUMP BELT REPLACEMENT

Removal Procedure

1. Remove [Front Compartment Air Deflector Replacement](#)
2. Remove [Front Wheelhouse Liner Replacement \(Left Side\)](#) [Front Wheelhouse Liner Replacement \(Right Side\)](#) - Right Side
3. Remove Heater Inlet Hose@Heater Coolant Heater [Heater Inlet Hose Replacement](#)
4. Remove Heater Inlet and Outlet Pipe@Heater Coolant Heater [Heater Inlet And Outlet Pipe Replacement](#)

Fig. 61: Water Pump Belt

Courtesy of GENERAL MOTORS COMPANY

5. Cut the water pump belt (2) with a appropriate cutting tool at position (1).
6. Remove Water Pump Belt (2) and DISCARD

Installation Procedure

Fig. 62: Water Pump Belt

Courtesy of GENERAL MOTORS COMPANY

1. Position a NEW water pump belt (3) on the water pump pulley (2) and partially install it on the crankshaft balancer (1) in preparation to walk the belt on the crankshaft pulley.
2. Rotate the crankshaft on the crankshaft balancer bolt (4) slowly clockwise until the belt is fully installed on the crankshaft balancer (1).
3. After the belt is on the crankshaft balancer, rotate the crankshaft an additional complete revolution and ensure the water pump belt is fully seated on the crankshaft balancer and water pump pulley.
4. Install Heater Inlet and Outlet Pipe@Heater Coolant Heater [Heater Inlet And Outlet Pipe Replacement](#)
5. Install Heater Inlet Hose@Heater Coolant Heater [Heater Inlet Hose Replacement](#)
6. Install [Front Wheelhouse Liner Replacement \(Left Side\)](#) [Front Wheelhouse Liner Replacement \(Right Side\)](#) - Right Side
7. Install [Front Compartment Air Deflector Replacement](#)

WATER PUMP REPLACEMENT

Removal Procedure

1. Remove [Water Pump Belt Replacement](#)
2. Remove [Exhaust Gas Recirculation Cooler Replacement](#)
3. Remove [Water Pump Inlet Adapter Replacement](#)
4. Remove [Radiator Outlet Hose Replacement](#)
5. Disconnect Electrical Connector@Heated Oxygen Sensor [Heated Oxygen Sensor Replacement - Sensor 1](#)

Fig. 63: Electrical Connector And Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Remove Retainer (1)
7. Disconnect Electrical Connector (2) @Engine Coolant Thermostat Housing

Fig. 64: Exhaust Gas Recirculation Cooler Water Bypass Outlet Hose And Water Pump
 Courtesy of GENERAL MOTORS COMPANY

8. Remove Clamp (5)
9. Remove the exhaust gas recirculation cooler water bypass outlet hose (6) from the water pump (1).

NOTE: Take note that there are different bolt lengths.

10. Remove Water Pump Bolt (2, 8)
11. Remove the 3 bolt retainers (3, 7).
12. Remove Water Pump (1)
13. Remove Water Pump Gasket (4) and DISCARD

Installation Procedure

Fig. 65: Exhaust Gas Recirculation Cooler Water Bypass Outlet Hose And Water Pump
 Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW gasket.(4)
2. Install Water Pump (1)

NOTE: Take note that there are different bolt lengths.

3. Install Water Pump Bolt(2, 8)

CAUTION: Fastener Caution

4. Tighten the NEW water pump bolts.25 N.m (18 lb ft)
5. Install the exhaust gas recirculation cooler water bypass outlet hose (6) to the water pump (1).
6. Install Clamp (5)

Fig. 66: Electrical Connector And Retainer
Courtesy of GENERAL MOTORS COMPANY

7. Install Retainer(1)
8. Connect Electrical Connector (2) @Engine Coolant Thermostat Housing
9. Connect Electrical Connector@Heated Oxygen Sensor Heated Oxygen Sensor Replacement - Sensor 1
10. Install Exhaust Gas Recirculation Cooler Replacement
11. Install Water Pump Inlet Adapter Replacement
12. Install Radiator Outlet Hose Replacement
13. Install Water Pump Belt Replacement

WATER PUMP HOUSING REPLACEMENT

Removal Procedure

1. Drain the cooling system. Cooling System Draining and Filling
2. Remove Water Pump Belt Replacement

Fig. 67: Water Pump Housing And Water Pump Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove Water Pump Bolt (1)
4. Remove Water Pump Housing (2)
5. Remove Water Pump Housing Gasket (3) and DISCARD
6. Remove the old gasket material from the water pump sealing surfaces.

Installation Procedure

Fig. 68: Water Pump Housing And Water Pump Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install a New Water Pump Housing Gasket (3).
2. Install Water Pump Housing (2)

CAUTION: **Fastener Caution**

- 3. Install Water Pump Bolt (1) and tighten 10 N.m (89 lb in)
- 4. Install [Water Pump Belt Replacement](#)
- 5. Fill the cooling system. [Cooling System Draining and Filling](#)

ENGINE COOLANT TEMPERATURE SENSOR REPLACEMENT - RADIATOR

Fig. 69: Engine Coolant Temperature Sensor

RADIATOR AIR UPPER BAFFLE AND DEFLECTOR REPLACEMENT

Removal Procedure

1. Remove [Front Intake Air Duct Replacement](#)
2. Remove [Pedestrian Sound Alert Speaker Replacement](#)

Fig. 113: Clip

Courtesy of GENERAL MOTORS COMPANY

NOTE: Graphic shows the radiator air upper baffle and deflector right side.

Procedure is also valid for the left side.

3. Unclip Clip (1)
4. Repeat the procedure for the other side.

Fig. 114: Clip

Courtesy of GENERAL MOTORS COMPANY

NOTE: Mind the different clip size.

5. Unclip Clip (1)
6. Remove Radiator Air Upper Baffle and Deflector (2)

Installation Procedure

Fig. 115: Clip

Courtesy of GENERAL MOTORS COMPANY

1. Install Radiator Air Upper Baffle and Deflector (2)

NOTE: Mind the different clip size.

2. Install Clip (1)

Fig. 116: Clip

Courtesy of GENERAL MOTORS COMPANY

NOTE: Graphic shows the radiator air upper baffle and deflector right side. Procedure is also valid for the left side.

3. Install Clip (1)
4. Repeat the procedure for the other side.
5. Install [Pedestrian Sound Alert Speaker Replacement](#)
6. Install [Front Intake Air Duct Replacement](#)

DESCRIPTION AND OPERATION

COOLING FAN DESCRIPTION AND OPERATION

Cooling Fan Control

The engine cooling fan(s) system is composed of 2 electric cooling fan(s), 2 fan motor(s) and 2 control module. The Hybrid/EV Powertrain Control Module 2 controls the fan speed by sending a pulse width modulated (PWM) signal to the cooling fan control module(s). The cooling fan control module(s) varies the voltage drop across the cooling fan motor(s) in relation to the pulse width modulated signal, which allows the cooling fan(s) to operate at variable speeds.

The cooling fan speed is effected by many different conditions and the Hybrid/EV Powertrain Control Module 2 will adjust the duty cycle from 0 - 100 percent based on cooling system requirements. The scan tool output control is only capable of operating the cooling fan(s) increments, between 10 - 90 percent. 90 percent is considered high speed fan. When multiple cooling fan speed requests are received, the Hybrid/EV Powertrain

Control Module 2 operates the fan(s) at the highest of speed requests. The ECM commands the fans ON under the following conditions:

- The engine coolant temperature is warmer than a predetermined temperature.
- The engine oil temperature is warmer than a predetermined temperature.
- The A/C pressure reaches a predetermined pressure.
- If the engine coolant temperature at key-off is warmer than a predetermined value, or the A/C pressure is greater than a predetermined value, the cooling fan(s) will operate at a low speed. The fan(s) will shut OFF if the temperature or pressure drops below the predetermined value, but will only operate for 2 minutes, regardless of the coolant temperature or A/C pressure.

Cooling System Electronic Component Description and Operation

Engine or Radiator Coolant Temperature Sensor

The engine coolant temperature (ECT) sensor or radiator coolant temperature (RCT) sensor is a variable resistor that measures the temperature of the engine or radiator coolant. The ECM supplies 5 V to the sensor signal circuit and a ground for the low reference circuit.

Engine Coolant Thermostat Heater

The ECM controls the pulse width modulated (PWM) thermostat heater circuit. The engine coolant thermostat heater helps control coolant flow and regulates the engine operating temperature. The ignition relay supplies 12 V to the thermostat through a fuse. The ECM controls the engine coolant thermostat heater by grounding the control circuit with a solid state device called a driver. The driver is equipped with a feedback circuit that is pulled-up to a voltage. The ECM can determine if the control circuit is open, shorted to ground, or shorted to a voltage by monitoring the feedback voltage.

COOLING SYSTEM DESCRIPTION AND OPERATION

This vehicle is equipped with three fully independent cooling systems. The power electronics cooling system is dedicated to cooling the battery charger and the power inverter module. The battery cooling system is dedicated to cooling and heating the high voltage battery. The engine cooling system is dedicated to cooling the engine and providing heat to the passenger compartment.

Engine Cooling System Description and Operation

The engine cooling system consists of a radiator, two 12 volt pulse width modulated (PWM) radiator fans, a 12 volt coolant pump, a coolant flow control valve, a high voltage heater and a heater core.

Fig. 117: Hybrid Cooling System Chart
Courtesy of GENERAL MOTORS COMPANY

The hybrid/EV powertrain control module 2 controls the radiator cooling fans. The cooling fans are controlled with a Pulse Width Modulated (PWM) signal. The hybrid/EV powertrain control module 2 diagnoses any faults with the hardwire circuit to the engine control module. The engine control module sends a fan request PWM signal to the hybrid/EV powertrain control module 2 through a hardwire circuit. The hybrid/EV powertrain control module 2 operates in a pass-through mode for the engine control module fan request. The higher the duty cycle the higher the cooling fan speed.

The hybrid/EV powertrain control module 2 sends a request to the engine control module for the cooling fans to be turned on. The engine control module uses this request and other vehicle inputs to decide if and what speed the cooling fans should operate. The engine control module sends the cooling fan command to the hybrid/EV powertrain control module 2. The hybrid/EV powertrain control module 2 sends the signal to the cooling fans to operate and at what speed.

If the vehicle is in Charge Mode and the hybrid/EV powertrain control module 2 requests the cooling fans to operate, if the engine control module is not awake, the hybrid/EV powertrain control module 2 will control the cooling fans. If active cooling is needed, the engine control module wakes up to operate the air conditioning control module and then the engine control module is the master controller for the fans.

Fig. 118: Engine Cooling System Flow Chart
 Courtesy of GENERAL MOTORS COMPANY

The HVAC Control Module turns on the coolant pump and monitors the temperature sensors in the passenger compartment, engine radiator, high voltage heater and the engine to determine the position of the coolant flow control valve and if the high voltage heater is needed. Passenger compartment heat is provided by air flowing through the heater core. The heater core is heated by coolant from either the engine or the high voltage heater.

The engine cooling system circulates a 50/50 mixture of DEX-COOL and distilled water.

SPECIAL TOOLS AND EQUIPMENT

SPECIAL TOOLS

Illustration	Tool Number/ Description
--------------	--------------------------------

Illustration	Tool Number/ Description
 A 3D illustration of a pair of blue hose clamp pliers. The tool consists of two long, tapered handles that meet at a central pivot point. The handles are made of a solid blue material. The jaws of the pliers are located at the bottom of the handles, featuring a curved, notched design for gripping hose clamps. The entire tool is rendered in a uniform blue color with some shading to indicate its three-dimensional form.	BO-38185 J-38185 Hose Clamp Pliers

Illustration	Tool Number/ Description
	EN-24460-A J-24460-A Cooling System Pressure Tester

Illustration	Tool Number/ Description
	EN-45059 Torque Angle Sensor Kit

Illustration	Tool Number/ Description
	GE-26568 J-26568 Coolant and Battery Tester

Illustration	Tool Number/ Description
 The illustration contains three separate line drawings of mechanical parts. The top drawing is a large, cylindrical cap with a wide, flat flange at one end and a series of vertical ridges or fins along its body. The bottom-left drawing is a smaller version of the same cap design. The bottom-right drawing is a different component, a cylindrical test adapter with multiple concentric rings and a flange at one end, suggesting it has multiple ports or connection points. Callout	Component Name
1	Catalytic Converter Gasket
2	Catalytic Converter Heat Shield
3	Catalytic Converter Heat Shield Bolt (Qty: 2)
4	Heated Oxygen Sensor
5	Catalytic Converter Heat Shield
6	Catalytic Converter Heat Shield Bolt (Qty: 6)
7	Heated Oxygen Sensor
8	Catalytic Converter Brace Bracket Nut (Qty: 2)
9	Catalytic Converter Brace Bracket
10	Catalytic Converter
11	Catalytic Converter Nut (Qty: 4)
12	Catalytic Converter Brace Bracket Bolt (Qty: 3)
13	Catalytic Converter Brace Bracket Nut (Qty: 2)
14	Catalytic Converter Brace Bracket

Exhaust Gas Recirculation Components

Fig. 22: Exhaust Gas Recirculation Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Thermostat Bypass Hose
2	Exhaust Gas Recirculation Cooler
3	Exhaust Gas Recirculation Cooler Bolt
4	Exhaust Gas Recirculation Cooler Bolt (Qty: 2)
5	Exhaust Gas Recirculation Cooler Temperature Sensor
6	Exhaust Gas Recirculation Cooler Inlet Pipe Gasket
7	Exhaust Gas Recirculation Cooler Water Bypass Outlet Hose
8	Exhaust Gas Recirculation Pipe Gasket
9	Exhaust Gas Recirculation Pipe
10	Exhaust Gas Recirculation Pipe Bolt (Qty: 2)
11	Exhaust Gas Recirculation Pipe Bolt
12	Exhaust Gas Recirculation Pipe Bolt (Qty: 2)
13	Exhaust Gas Recirculation Pipe Gasket
14	Exhaust Gas Recirculation Cooler Outlet Pipe
15	Exhaust Gas Recirculation Cooler Outlet Pipe Bolt (Qty: 2)
16	Exhaust Gas Recirculation Cooler Outlet Pipe Gasket
17	Exhaust Gas Recirculation Cooler Temperature Sensor

Water Pump and Components

Fig. 23: Water Pump And Components
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Water Pump Housing Gasket
2	Water Outlet Gasket
3	Water Outlet
4	Water Outlet Bolt (Qty: 2)
5	Thermostat Bypass Pipe Bolt
6	Water Pump Inlet Hose Fitting
7	Thermostat Bypass Pipe Gasket
8	Water Pump Housing Bolt (Qty: 3)
9	Engine Coolant Thermostat Housing Bolt (Qty: 2)
10	Engine Coolant Thermostat Housing
11	Engine Coolant Thermostat Housing Gasket
12	Water Pump Rear Housing
13	Water Pump Gasket
14	Water Pump Housing
15	Water Pump Bolt (Qty: 5)

Intake Manifold and Components

Fig. 24: Intake Manifold And Components

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Evaporative Emission Canister Purge Solenoid Valve Bolt
2	Evaporative Emission Canister Purge Solenoid Valve
3	Manifold Absolute Pressure Sensor
4	Manifold Absolute Pressure Sensor Bolt
5	Throttle Body Gasket
6	Throttle Body Bolt (Qty: 4)
7	Throttle Body
8	Intake Manifold Gasket
9	Intake Manifold Cover Bolt (Qty: 3)
10	Lower Intake Manifold Cover
11	Intake Manifold Bolt (Qty: 5)
12	Upper Intake Manifold Cover
13	Upper Intake Manifold Cover Bolt (Qty: 3)

Oil Pan and Components

Fig. 25: Oil Pan and Components

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Lower Crankcase
2	Crankshaft Oil Deflector
3	Crankshaft Oil Deflector Bolts (Qty: 3)
4	Oil Pump Gasket
5	Oil Pump Assembly Locating Pin
6	Oil Pump Gasket
7	Oil Pump Assembly Bolt (Qty: 4)
8	Oil Pump Assembly
9	Oil Pump Flow Control Solenoid Valve
10	Oil Pump Flow Control Solenoid Valve Retainer
11	Positive Crankcase Ventilation Oil Separator Drain Pipe O-ring
12	Positive Crankcase Ventilation Oil Separator Drain Pipe Bolt
13	Positive Crankcase Ventilation Oil Separator Drain Pipe
14	Upper Oil Pan Locating Pin (Qty: 2)
15	Upper Oil Pan Assembly
16	Lower Oil Pan Locating Pin (Qty: 2)
17	Upper Oil Pan Bolt (Qty: 12)

Callout	Component Name
18	Lower Oil Pan
19	Oil Drain Plug O-ring
20	Oil Pan Drain Plug
21	Lower Oil Pan Bolt (Qty: 12)
22	Upper Oil Pan Bolt (Qty: 2)
23	Upper Oil Pan Bolt (Qty: 2)

Timing Chain and Components

Fig. 26: Timing Chain and Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Timing Chain
2	Timing Chain Guide - to Cylinder Head
3	Timing Chain Guide Bolt
4	Camshaft Position Actuator Bolt
5	Camshaft Position Actuator Assembly - Intake
6	Camshaft Position Actuator Assembly - Exhaust
7	Camshaft Position Actuator Bolt
8	Timing Chain Guide - Exhaust Side

Callout	Component Name
9	Crankshaft Sprocket
10	Oil Pump Assembly
11	Oil Pump Drive Chain Tensioner Assembly
12	Oil Pump Drive Chain Tensioner Bolt
13	Oil Pump Drive Chain
14	Timing Chain Guide Bolt (Qty: 3)
15	Timing Chain Oil Nozzle
16	Timing Chain Tensioner Shoe Assembly
17	Timing Chain Tensioner Assembly
18	Timing Chain Tensioner Bolt
19	Timing Chain Tensioner Shoe Bolt

ENGINE IDENTIFICATION

Fig. 27: Engine Identification Code

Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine identification number must be stamped to the cylinder block in case of engine replacement.

The engine identification code (1) is stamped on the flattened area of the cylinder block, at the transmission side.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P06DA-P06DE: ENGINE OIL PRESSURE CONTROL SOLENOID VALVE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: [Diagnostic System Check - Vehicle](#)
- Review the description of Strategy Based Diagnosis: [Strategy Based Diagnosis](#)
- An overview of each diagnostic category can be found here: [Diagnostic Procedure Instructions](#)

DTC Descriptor

DTC P06DA

Engine Oil Pressure Control Solenoid Valve Control Circuit

DTC P06DB

Engine Oil Pressure Control Solenoid Valve Control Circuit Low Voltage

DTC P06DC

Engine Oil Pressure Control Solenoid Valve Control Circuit High Voltage

DTC P06DD

Engine Oil Pressure Control Solenoid Valve Stuck Off

DTC P06DE

Engine Oil Pressure Control Solenoid Valve Stuck On

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P06DA, P06DB*	P06DA, P06DB	-	-
Control	P06DB	P06DA	P06DC	P06DD, P06DE
*Additional DTCs may set.				

Circuit/System Description

Circuit	Description
Ignition	Supplied from a fuse.
Control	The output circuit is switched to ground to activate the component.

Component	Description
K20 Engine Control Module	The control module controls a series of actuators to ensure optimal engine performance. The control module does this by reading values from a variety of sensors, interprets the data and adjusts the engine actuators accordingly.

Component	Description
Q44 Engine Oil Pressure Control Solenoid Valve	A solenoid valve is an electro-mechanically operated valve. The valve is controlled by an electric current through the solenoid.

The engine oil pressure control solenoid valve is used to control engine oil pressure inside the mechanical engine oil pump. The control module controls the commanded state of the solenoid valve based on the following inputs:

- Engine Speed
- Calculated Engine Oil Temperature
- Engine Oil Pressure
- Engine Run Time

When the solenoid valve is commanded Off, oil pressure is higher. When the solenoid valve is commanded On, oil pressure is lower.

Conditions for Running the DTC

DTC P06DA, P06DB, P06DC

- Ignition Voltage = Greater than 11 V
- Engine = Running

DTCs run continuously when the above conditions are met.

DTC P06DD

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0335, P0336, P0521, P0522, P0523, P06DA, P06DB, P06DC, P06DD, P06DE, P111E, P2227, P2228, P2229, P2230 = Not set
- Engine Speed = 1,500 to 2,500 RPM

DTCs run continuously when the above conditions are met.

DTC P06DE

- DTC P0101, P0102, P0103, P0106, P0107, P0108, P0111, P0112, P0113, P0114, P0117, P0118, P0119, P0128, P0335, P0336, P0521, P0522, P0523, P06DA, P06DB, P06DC, P06DD, P06DE, P111E, P2227, P2228, P2229, P2230 = Not set
- Engine = Running - For greater than 1.5 s
- Engine Speed = 1,500 to 2,500 RPM
- Engine Oil Pressure Control Solenoid Valve = On - For greater than 1.5 s

DTCs run continuously when the above conditions are met.

Conditions for Setting the DTC

DTC P06DA, P06DB, P06DC

Control Circuit = Commanded state does not match the actual state - For 1 s

DTC P06DD

Engine Oil Pressure = Less than a predefined threshold

DTC P06DE

Engine Oil Pressure = Greater than a predefined threshold

Actions Taken When the DTC Sets

- DTCs P06DB, P06DE are Type A DTCs.
- DTCs P06DA, P06DC, P06DD are Type B DTCs.
- Engine Oil Pressure Control Solenoid Valve = Off
- Reduced Engine Power = Active

Conditions for Clearing the DTC

- DTCs P06DA, P06DC, P06DD are Type B DTCs.
- DTCs P06DB, P06DE are Type A DTCs.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References

Circuit/System Verification

NOTE: The engine oil level and condition is critical to the correct operation of the system.

1. Ignition - On/Vehicle - In Service Mode
2. Verify there are no DTCs set related to the following system/component:
 - B35B Engine Oil Level Sensor

- B37B Engine Oil Pressure Sensor
- B37 Engine Oil Pressure Switch
- **If other DTCs are set**

Refer to [Diagnostic Trouble Code \(DTC\) List - Vehicle](#)

- **If no other DTCs are set**

3. Verify the condition does not exist:

- Low Engine Oil Level
- Dirty or contaminated oil
- **If a condition exists**

Repair as necessary

- **If no condition exists**

4. Perform the scan tool control function: Engine Oil Pressure Control Solenoid Valve - Low Pressure - High Pressure

Verify the scan tool parameter:

- Engine Oil Pressure Control Solenoid Valve Control Circuit Low Voltage Test Status = OK or Not Run
- Engine Oil Pressure Control Solenoid Valve Control Circuit Open Test Status = OK or Not Run
- Engine Oil Pressure Control Solenoid Valve Control Circuit High Voltage Test Status = OK or Not Run
- **If not the specified state**

Refer to: Circuit/System Testing

- **If the specified state**

5. Engine running.

6. Perform the following steps:

1. Increase the engine speed slowly to 1,800 RPM.

NOTE: Using the scan tool line graph function may make it easier to identify if the value changes.

2. Perform the scan tool control function: Engine Oil Pressure Control Solenoid Valve - Low Pressure

Verify the scan tool parameter: Engine Oil Pressure = Change is greater than 30 kPa (4 PSI)

- If the change is 30 kPa (4 PSI) or less - Replace the component: Q44 Engine Oil Pressure Control Solenoid Valve
- If the change is greater than 30 kPa (4 PSI)

7. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Verify the DTC does not set.

- **If the DTC sets**

Refer to: Circuit/System Testing

- **If the DTC is not set**

8. All OK.

Circuit/System Testing

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: Inline Harness Connector
3. Ignition - On/Vehicle - In Service Mode

NOTE: **Testing for steps 4 to 9 is performed on the control module K20 side of the inline harness connector.**

4. Verify a test lamp turns On between the test points: Ignition circuit terminal 5 & Ground

- **If the test lamp does not turn On and the circuit fuse is OK**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Test for less than 2 ohms between the test points: Ignition circuit terminal 5 & Fuse
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not turn On and the circuit fuse is open**

1. Ignition/Vehicle - Off & Remove - Test lamp

NOTE: **The ignition circuit supplies voltage to other components. Test all circuits for a short to ground or test all components for being shorted.**

2. Test for infinite resistance between the test points: Ignition circuit terminal 5 & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Refer to: Step 10

- **If the test lamp turns On**

5. Verify a test lamp does not turn On between the test points: Control circuit terminal 4 & B+

- **If the test lamp turns On**

1. Ignition/Vehicle - Off & Remove - Test lamp
2. Disconnect the electrical connector: K20 Engine Control Module
3. Test for infinite resistance between the test points: Inline Harness Connector Control circuit terminal 4 & Ground
 - If less than infinite resistance - Repair the short to ground on the circuit.
 - If infinite resistance - Replace the component: K20 Engine Control Module

- **If the test lamp does not turn On**

6. Remove - Test Lamp

7. Perform the scan tool control function: Engine Oil Pressure Control Solenoid Valve - Low Pressure

Verify the scan tool parameter: Engine Oil Pressure Control Solenoid Valve Control Circuit High Voltage Test Status = OK or Not Run

- **If not the specified state**

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: K20 Engine Control Module
3. Test for less than 1 V between the test points: Inline Harness Connector Control circuit terminal 4 &

Ground

- If 1 V or greater - Repair the short to voltage on the circuit.
- If less than 1 V - Replace the component: K20 Engine Control Module

- **If the specified state**

8. Connect a 3 A fused jumper wire between the test points: Control circuit terminal 4 & Ignition circuit terminal 5
9. Perform the scan tool control function: Engine Oil Pressure Control Solenoid Valve - Low Pressure

Verify the scan tool parameter: Engine Oil Pressure Control Solenoid Valve Control Circuit High Voltage Test Status = Malfunction

- **If not the specified state**

1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
2. Disconnect the electrical connector: K20 Engine Control Module
3. Test for less than 2 ohms between the test points: Inline Harness Connector Control circuit terminal 4 & The other end of the circuit
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Replace the component: K20 Engine Control Module

- **If the specified state**

NOTE: **Testing for steps 10 to 12 is performed on the component side of the inline harness connector: Q44 Engine Oil Pressure Control Solenoid Valve**

10. Test for 10 to 30 ohms between the test points: Control circuit terminal 4 & Ignition circuit terminal 5

- **If not between 10 and 30 ohms**

1. Disconnect the electrical connector: Q44 Engine Oil Pressure Control Solenoid Valve
2. Test for less than 2 ohms between the test points:
 - Ignition circuit terminal 5 & The other end of the circuit
 - Control circuit terminal 4 & The other end of the circuit
 - If 2 ohms or greater - Repair the open/high resistance in the circuit.
 - If less than 2 ohms - Test or replace the component: Q44 Engine Oil Pressure Control Solenoid Valve

- **If between 10 and 30 ohms**

11. Test for infinite resistance between the test points:

- Ignition circuit terminal 5 & Ground
- Control circuit terminal 4 & Ground
- **If less than infinite resistance**

Repair the short to ground on the circuit.

- **If infinite resistance**

12. Test for less than 1 V between the test points:

- Ignition circuit terminal 5 & Ground
- Control circuit terminal 4 & Ground
- **If 1 V or greater**

Repair the short to voltage on the circuit.

- **If less than 1 V**

13. Test or replace the component: Q44 Engine Oil Pressure Control Solenoid Valve

Component Testing

Static Test

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: Q44 Engine Oil Pressure Control Solenoid Valve
3. Test for 10 to 30 ohms between the test points: Control terminal 2/B & Ignition terminal 1/A
 - **If not between 10 and 30 ohms**
Replace the component: Q44 Engine Oil Pressure Control Solenoid Valve
 - **If between 10 and 30 ohms**
4. Test for infinite resistance between the test points: Each terminal of the component & The component's housing
 - **If less than infinite resistance**
Replace the component: Q44 Engine Oil Pressure Control Solenoid Valve
 - **If infinite resistance**
5. All OK.

Dynamic Test

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: Q44 Engine Oil Pressure Control Solenoid Valve
3. Connect a 10 A fused jumper wire between the test points: Ignition terminal 1/A & 12 V

CAUTION: Complete the testing as quickly as possible in order to prevent overheating and damaging the component.

4. Momentarily connect a jumper wire between the test points: Control terminal 2/B & Ground

Verify the component turns On and Off when connecting and disconnecting the jumper wire: Q44 Engine Oil Pressure Control Solenoid Valve

- **If the component does not turn On and Off**

Replace the component: Q44 Engine Oil Pressure Control Solenoid Valve

- **If the component turns On and Off**

5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: [Diagnostic Repair Verification](#)

- Refer to [Oil Pump Flow Control Solenoid Valve Replacement](#) - Q44 Engine Oil Pressure Control Solenoid Valve
- For control module replacement, programming, and setup refer to: [Control Module References](#)

SYMPTOMS - ENGINE MECHANICAL

Strategy Based Diagnostics

Perform the **Diagnostic System Check - Vehicle** .

All diagnosis on a vehicle should follow a logical process. Strategy based diagnostics is a uniform approach for repairing all systems. The diagnostic flow may always be used in order to resolve a system condition. The diagnostic flow is the place to start when repairs are necessary.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the engine.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for the correct oil level, proper oil viscosity, and correct filter application.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, ambient temperature, engine temperature, amount of engine warm-up time, and other specifics.
- Compare the engine sounds, if applicable, to a known good engine and make sure you are not trying to correct a normal condition.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating properly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Engine Noise Under Load**
- **Base Engine Misfire without Internal Engine Noises**
- **Base Engine Misfire with Abnormal Internal Lower Engine Noises**
- **Base Engine Misfire with Abnormal Valve Train Noise**
- **Base Engine Misfire with Coolant Consumption**
- **Base Engine Misfire with Excessive Oil Consumption**
- **Engine Noise on Start-Up, but Only Lasting a Few Seconds**
- **Upper Engine Noise, Regardless of Engine Speed**
- **Lower Engine Noise, Regardless of Engine Speed**
- **Engine Will Not Crank - Crankshaft Will Not Rotate**
- **Coolant in Engine Oil**
- **Engine Compression Test**
- **Oil Consumption Diagnosis**
- **Oil Pressure Diagnosis and Testing**
- **Oil Leak Diagnosis**

OIL PRESSURE DIAGNOSIS AND TESTING

Special Tools

- **CH-48027** Digital Pressure Gauge

- **EN-21867-850** Oil Pressure Gauge Adapter

For equivalent regional tools, refer to [Special Tools](#).

Procedure

Fig. 28: Engine Oil Pressure Sensor

Courtesy of GENERAL MOTORS COMPANY

1. Remove the engine oil pressure sensor (1).

Fig. 29: Adapter And Gauge

Courtesy of GENERAL MOTORS COMPANY

2. Install the **EN-21867-850** adapter (1).
3. Install the **CH-48027** gauge (2).
4. Start the engine.
5. Check oil pressure.
6. At idling speed, the oil pressure must be greater than 180 kPa (26.11 psi) and the oil temperature must be 85°C (185°F) or more.
7. Remove the **CH-48027** gauge (2).
8. Remove the **EN-21867-850** adapter (1).
9. Turn off the engine.

Fig. 30: Engine Oil Pressure Sensor
Courtesy of GENERAL MOTORS COMPANY

10. Install the engine oil pressure sensor (1).
11. Tighten the sensor to 35 N.m (26 lb ft).
12. Check the engine oil level.

OIL LEAK DIAGNOSIS

Step	Action	Yes	No
DEFINITION: You can repair most fluid leaks by first, visually locating the leak, repairing or replacing the component, or by resealing the gasket surface. Once the leak is identified, determine the cause of the leak. Repair the leak and the cause of the leak.			
1	1. Operate the vehicle until it reaches normal operating temperature. Refer to <u>Engine Mechanical Specifications</u>. 2. Park the vehicle on a level surface over a large sheet of paper or other clean surface. 3. Wait 15 minutes. 4. Inspect for drippings.		
	Are drippings present?	Go to Step 2	System OK

Step	Action	Yes	No
2	Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 3
3	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 4
4	1. Completely clean the entire engine and surrounding components. 2. Operate the vehicle for several miles at normal operating temperature and at varying speeds. 3. Park the vehicle on a level surface over a large sheet of paper or other clean surface. 4. Wait 15 minutes. 5. Identify the type of fluid and the approximate location of the leak. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 5
5	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 6
6	1. Completely clean the entire engine and surrounding components. 2. Apply an aerosol-type powder, for example, baby powder or foot powder, to the suspected area. 3. Operate the vehicle for several miles at normal operating temperature and at varying speeds. 4. Identify the type of fluid and the approximate location of the leak from the discolorations in the powder surface. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 7
7	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas.	Go to Step 10	Go to Step 8

Step	Action	Yes	No
	2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?		
8	Identify the type of fluid and the approximate location of the leak. Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	Go to Step 9
9	1. Visually inspect the suspected area. Use a small mirror to assist in looking at hard to see areas. 2. Inspect for leaks at the following locations: • Sealing surfaces • Fittings • Cracked or damaged components Can you identify the type of fluid and the approximate location of the leak?	Go to Step 10	System OK
10	1. Inspect the engine for mechanical damage. Special interest should be shown to the following areas: • Higher than recommended fluid levels • Higher than recommended fluid pressures • Plugged or malfunctioning fluid filters or pressure bypass valves • Plugged or malfunctioning engine ventilation system • Improperly tightened or damaged fasteners • Cracked or porous components • Improper sealants or gaskets, where required • Improper sealant or gasket installation • Damaged or worn gaskets or seals • Damaged or worn sealing surfaces 2. Inspect the engine for customer modifications. Is there mechanical damage or customer modifications to the engine?	Go to Step 11	System OK
11	Repair or replace all damaged or modified components. Did you complete the repair?	Go to Step 1	-

OIL CONSUMPTION DIAGNOSIS

Excessive oil consumption, not due to leaks, is the use of 0.9 L (1 quart) or greater of engine oil within 3,200 kilometers (2,000 miles). The causes of excessive oil consumption include the following conditions:

- External oil leaks

Tighten bolts and/or replace gaskets and oil seals as necessary.

- Incorrect oil level or improper reading of oil level indicator

With the vehicle on a level surface, allow adequate drain down time and inspect for the correct oil level.

- Improper oil viscosity

Use recommended SAE viscosity for the prevailing temperatures.

- Continuous high speed driving and/or severe usage
- Crankcase ventilation system restrictions or malfunctioning components
- Valve guides and/or valve stem oil seals worn, or the seal omitted

Ream guides and install oversize service valves and/or new valve stem oil seals.

- Piston rings broken, improperly installed, worn, or not seated properly

Allow adequate time for rings to seat. Replace broken or worn rings, as necessary.

- Piston improperly installed or mis-fitted.

COOLANT IN COMBUSTION CHAMBER

Cause	Correction
DEFINITION: Excessive white smoke and/or coolant type odor coming from the exhaust pipe may indicate coolant in the combustion chamber. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an overheating condition which may cause engine component damage.	
NOTE: While not always conclusive, use of hydrocarbon block test kits may reveal hydrocarbons indicating combustion chamber gases in cooling system. It is important to follow the kit instructions. This is not a substitute for service information. Combustion	

Cause	Correction
leak tests are available from a wide variety of aftermarket suppliers. 1. A slower than normal cranking speed may indicate coolant entering the combustion chamber. Refer to Engine Will Not Crank - Crankshaft Will Not Rotate. 2. Remove the spark plugs and inspect for spark plugs saturated by coolant or coolant in the cylinder bore. 3. Inspect by performing a cylinder leak-down test. During this test, excessive air bubbles within the coolant may indicate a faulty gasket or damaged component. 4. Inspect by performing a cylinder compression test. Two cylinders side-by-side on the engine block, with low compression, may indicate a failed cylinder head gasket. Refer to Engine Compression Test.	
Faulty cylinder head gasket	Replace the head gasket and components as required. Refer to Cylinder Head Cleaning and Inspection , and Cylinder Head Replacement .
Warped cylinder head	Replace the cylinder head and gasket. Refer to Cylinder Head Replacement .
Cracked cylinder head	Replace the cylinder head and gasket. Refer to Cylinder Head Replacement .
Cracked cylinder liner	Replace the components as required.
Cylinder head or block porosity	Replace the components as required.

COOLANT IN ENGINE OIL

Cause	Correction
DEFINITION: Foamy or discolored oil or an engine oil overfill condition may indicate coolant entering the engine crankcase. Low coolant levels, an inoperative cooling fan, or a faulty thermostat may lead to an overtemperature condition which may cause engine component damage. Contaminated engine oil and oil filter should be changed. 1. Inspect the oil for excessive foaming or an overfill condition. Oil diluted by coolant may not properly lubricate the crankshaft bearings and may lead to component damage. Refer to Lower Engine Noise, Regardless of Engine Speed. 2. Inspect by performing a cylinder leak-down test. During this test, excessive air bubbles within the cooling system may indicate a faulty gasket or damaged component. 3. Inspect by performing a cylinder compression test. Two cylinders side-by-side on the engine block with low compression may indicate a failed cylinder head gasket. Refer to Engine Compression Test.	
Faulty cylinder head gasket	Replace the head gasket and components as required. Refer to Cylinder Head Replacement .
Warped cylinder head	Replace the cylinder head and gasket. Refer to Cylinder Head Replacement .
Cracked cylinder head	Replace the cylinder head and gasket. Refer to Cylinder Head Replacement .
Cracked cylinder liner	Replace the components as required.
Cylinder head or block porosity	Replace the components as required.

ENGINE NOISE UNDER LOAD

Cause	Correction
Low oil pressure	1. Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. 2. Repair or replace as required.
Detonation or spark knock	Verify the correct operation of the ignition. Refer to Symptoms - Engine Controls .
Loose torque converter bolts	1. Inspect the torque converter bolts and flywheel. 2. Repair as required.
Cracked flywheel - automatic transmission	1. Inspect the flywheel bolts and flywheel. 2. Repair as required.
Excessive connecting rod bearing clearance	Inspect the following components and repair as required: • The connecting rod bearings • The connecting rods • The crankshaft
Excessive crankshaft bearing clearance	Inspect the following components and repair as required: • The crankshaft bearings • The crankshaft journals • The cylinder block crankshaft bearing bore

ENGINE NOISE ON START-UP, BUT ONLY LASTING A FEW SECONDS

Cause	Correction
Incorrect oil filter without anti-drainback feature	Install the correct oil filter.
Incorrect oil viscosity	1. Drain the oil. 2. Install the correct viscosity oil.
High valve lash adjuster leak down rate	Replace the lash adjusters as required.
Worn crankshaft thrust bearing	1. Inspect the thrust bearing and crankshaft. 2. Repair or replace as required.
Damaged or faulty oil filter by-pass valve	1. Inspect the oil filter by-pass valve for proper operation. 2. Repair or replace as required.
Malfunctioning camshaft position actuators - improper oil viscosity or contamination. The result is camshaft actuator locking pin does not lock	1. Verify correct engine oil viscosity by changing the engine oil and filter. Reevaluate the concern. 2. Isolate the noise to a specific camshaft position

Cause	Correction
	actuator. 3. Replace the camshaft actuator, oil and filter.

BASE ENGINE MISFIRE WITHOUT INTERNAL ENGINE NOISES

Cause	Correction
Abnormalities, severe cracking, bumps, or missing areas in the accessory drive belt Abnormalities in the accessory drive system and/or components may cause engine RPM variations and lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Replace the drive belt.
Worn, damaged, or mis-aligned accessory drive components or excessive pulley runout may lead to a misfire DTC. A misfire code may be present without an actual misfire condition.	Inspect the components, and repair or replace as required.
A loose or improperly installed engine flywheel or crankshaft balancer A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required.
Restricted exhaust system A severe restriction in the exhaust flow can cause significant loss of engine performance and may set a DTC. Possible causes of restrictions include collapsed or dented pipes or plugged mufflers and/or catalytic converters.	Repair or replace as required.
Improperly installed or damaged vacuum hoses	Repair or replace as required.
Improper sealing between the intake manifold and cylinder heads or throttle body	Replace the intake manifold, gaskets, cylinder heads, and/or throttle body as required.
Improperly installed or damaged manifold absolute pressure (MAP) sensor The sealing grommet of the MAP sensor should not be torn or damaged.	Repair or replace the MAP sensor as required.
Damage to the MAP sensor housing	Replace the intake manifold.
Worn rocker arms	Replace the valve rocker arms as required.
Stuck valves Carbon buildup on the valve stem can cause the valve not to close properly.	Repair or replace as required.
Excessively worn or mis-aligned timing chain	Replace the timing chain and sprockets as required.
Worn camshaft lobes	Replace the camshaft and valve lifters.
Excessive oil pressure A lubrication system with excessive oil pressure may lead to excessive valve lifter pump up and loss of compression.	• Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. • Repair or replace the oil pump as required.
Faulty cylinder head gaskets and/or cracking or other damage to the cylinder heads and engine block cooling system passages	• Inspect for spark plugs saturated by coolant. • Inspect the cylinder heads, engine block, and/or head gaskets.

Cause	Correction
Coolant consumption may or may not cause the engine to overheat.	• Repair or replace as required.
Worn piston rings Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform cylinder leak down and compression testing to identify the cause. • Repair or replace as required.
A damaged crankshaft reluctor wheel A damaged crankshaft reluctor wheel can result in different symptoms depending on the severity and location of the damage. • Systems with electronic communications, DIS or coil per cylinder, and severe reluctor ring damage may exhibit periodic loss of crankshaft position, stop delivering a signal, and then re-sync the crankshaft position. • Systems with electronic communication, DIS or coil per cylinder, and slight reluctor ring damage may exhibit no loss of crankshaft position and no misfire may occur. However, a DTC P0300 may be set. • Systems with mechanical communications, high voltage switch, and severe reluctor ring damage may cause additional pulses and effect fuel and spark delivery to the point of generating a DTC P0300 or P0336.	Replace the sensor and/or crankshaft as required.

BASE ENGINE MISFIRE WITH ABNORMAL INTERNAL LOWER ENGINE NOISES

Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt Abnormalities in the accessory drive system and/or components may cause engine RPM variations, noises similar to a faulty lower engine, and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.	Replace the drive belt.
Worn, damaged, or mis-aligned accessory drive components or excessive pulley runout A misfire code may be present without an actual misfire condition.	Inspect the components, repair or replace as required.
Loose or improperly installed engine flywheel or crankshaft balancer A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required.

Cause	Correction
Worn piston rings Oil consumption may or may not cause the engine to misfire.	- Inspect the spark plugs for oil deposits. - Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. - Perform cylinder leak down and compression testing to determine the cause. - Repair or replace as required.
Worn crankshaft thrust bearings Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft, and create a DTC without an actual misfire condition.	Replace the crankshaft and bearings as required.

BASE ENGINE MISFIRE WITH ABNORMAL VALVE TRAIN NOISE

Cause	Correction
Abnormalities, severe cracking, bumps or missing areas in the accessory drive belt Abnormalities in the accessory drive system and/or components may cause engine RPM variations, noises similar to a faulty lower engine, and also lead to a misfire condition. A misfire code may be present without an actual misfire condition.	Replace the drive belt.
Worn, damaged, or mis-aligned accessory drive components or excessive pulley runout A misfire code may be present without an actual misfire condition.	Inspect the components, repair or replace as required.
Loose or improperly installed engine flywheel or crankshaft balancer A misfire code may be present without an actual misfire condition.	Repair or replace the flywheel and/or balancer as required.
Worn piston rings Oil consumption may or may not cause the engine to misfire.	- Inspect the spark plugs for oil deposits. - Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. - Perform cylinder leak down and compression testing to determine the cause. - Repair or replace as required.
Worn crankshaft thrust bearings Severely worn thrust surfaces on the crankshaft and/or thrust bearing may permit fore and aft movement of the crankshaft, and create a DTC without an actual misfire condition.	Replace the crankshaft and bearings as required.

BASE ENGINE MISFIRE WITH COOLANT CONSUMPTION

Cause	Correction
Faulty cylinder head gasket and/or cracking, or other damage to the cylinder head and engine block cooling	Inspect for spark plugs saturated by coolant.

Cause	Correction
system passages. Coolant consumption may or may not cause the engine to overheat.	• Perform a cylinder leak down test. • Inspect the cylinder head and engine block for damage to the coolant passages and/or a faulty head gasket. • Repair or replace as required.

BASE ENGINE MISFIRE WITH EXCESSIVE OIL CONSUMPTION

Cause	Correction
Worn valves, valve guides, and/or valve stem oil seals	• Inspect the spark plugs for oil deposits. • Repair or replace as required.
Worn piston rings Oil consumption may or may not cause the engine to misfire.	• Inspect the spark plugs for oil deposits. • Inspect the cylinders for a loss of compression. Refer to Engine Compression Test. • Perform cylinder leak down and compression testing to determine the cause. • Repair or replace as required.

UPPER ENGINE NOISE, REGARDLESS OF ENGINE SPEED

Cause	Correction
Low oil pressure	• Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. • Repair or replace as required.
Worn valve rocker arm	Replace the valve rocker arm.
Improper lubrication to the valve rocker arms	Inspect the following components and repair or replace as required: • The valve rocker arm • The valve lifter • The oil filter bypass valve • The oil pump and pump screen • The engine block oil galleries
Broken valve spring	Replace the valve spring.
Worn or dirty valve lifters	Replace the valve lifters.
Stretched timing chain and/or damaged sprocket teeth	Replace the timing chain and sprockets.
Worn, damaged, or faulty timing chain tensioner	Replace the tensioner.
Worn engine camshaft lobes	• Inspect the engine camshaft lobes. • Replace the camshaft and valve lifters as required.

Cause	Correction
Worn valve guides or valve stems	Inspect the following components, and repair as required: • The valves • The valve guides
Stuck valves Carbon on the valve stem or valve seat may cause the valve to stay open.	Inspect the following components and repair as required: • The valves • The valve guides

LOWER ENGINE NOISE, REGARDLESS OF ENGINE SPEED

Cause	Correction
Low oil pressure	• Perform an oil pressure test. Refer to Oil Pressure Diagnosis and Testing. • Repair or replace damaged components as required.
Worn accessory drive components - abnormalities, such as severe cracking, bumps, or missing areas in the accessory drive belt and/or misalignment of system components	1. Inspect the accessory drive system. 2. Repair or replace as required.
Loose or damaged crankshaft balancer	1. Inspect the crankshaft balancer. 2. Repair or replace as required.
Detonation or spark knock	Verify the correct operation of the ignition system. Refer to Symptoms - Engine Controls .
Loose torque converter bolts	1. Inspect the torque converter bolts and flywheel. 2. Repair or replace as required.
Loose or damaged flywheel	Repair or replace the flywheel.
Damaged oil pan, contacting the oil pump screen An oil pan that has been damaged, may improperly position the oil pump screen, preventing proper oil flow to the oil pump.	1. Inspect the oil pan. 2. Inspect the oil pump screen. 3. Repair or replace as required.
Oil pump screen loose, damaged or restricted	1. Inspect the oil pump screen. 2. Repair or replace as required.
Excessive piston-to-cylinder bore clearance	1. Inspect the piston and cylinder bore. 2. Repair as required.
Excessive piston pin-to-bore clearance	1. Inspect the piston, piston pin, and the connecting rod. 2. Repair or replace as required.

ENGINE WILL NOT CRANK - CRANKSHAFT WILL NOT ROTATE

Cause	Correction
Seized accessory drive system component	1. Remove accessory drive belts. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Hydraulically locked cylinder • Coolant/antifreeze in cylinder • Oil in cylinder • Fuel in cylinder	1. Remove spark plugs and check for fluid. 2. Inspect for broken head gasket. 3. Inspect for cracked engine block or cylinder head. 4. Inspect for a sticking fuel injector. 5. Inspect for cracked cylinder wall.
Seized automatic transmission torque converter	1. Remove the torque converter bolts. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Seized manual transmission	1. Disengage the clutch. 2. Rotate crankshaft by hand at the balancer or flywheel location.
Broken timing chain and/or gears	• Inspect timing chain and gears. • Repair as required.
Seized balance shaft	• Inspect balance shaft. • Repair as required.
Material in cylinder • Broken valve • Piston material • Foreign material • Cracked cylinder wall	• Inspect cylinder for damaged components and/or foreign materials. • Inspect for fallen cylinder wall. • Repair or replace as required.
Seized crankshaft or connecting rod bearings	• Inspect crankshaft and connecting rod bearings. • Inspect for fallen cylinder wall. • Repair as required.
Bent or broken connecting rod	• Inspect connecting rods. • Repair as required.
Broken crankshaft	• Inspect crankshaft. • Repair as required.

Cause	Correction
Seized automatic transmission - hybrid	Seized Engine or Transmission Separation

ENGINE COMPRESSION TEST

Special Tools

EN-51749 Compression Gauge Tester Kit

For equivalent regional tools, refer to [Special Tools](#).

Removal Procedure

NOTE: DO NOT leave vehicle connected to charge port or theft deterrent system will be active and compression test will not run.

1. Bring vehicle into service bay and make sure vehicle has at least 50% charge.
2. Remove the ignition coils. Refer to [Ignition Coil Replacement](#).
3. Remove the spark plugs. Refer to [Spark Plug Replacement](#).

Diagnostic Procedure

NOTE: In order to perform the compression test it will be necessary to use GDS in order to crank engine.

1. Place vehicle into service mode and connect GDS.

NOTE: The drivers door must remain open and vehicle is turned off. This will ensure that the theft deterrent feature is not active.

2. Once vehicle VIN is recorded and you are at the vehicle selection screen select "Enter" and then select "Module Diagnostics" - "Engine Control Module" then "Control Functions" on the menu screens DO NOT select "Compression Test" at this time. When you reach this point stop and turn off vehicle and leave the drivers door open.

NOTE: You must select crank on the compression test diagnostic screen within 10 seconds of turning key on or the theft deterrent feature will be enabled and the compression test will not run. If this occurs it will be necessary to turn off vehicle for at least one minute and then back on to reset this feature.

3. Without compression gauge attached put vehicle back into service mode then select compression test and then select crank on the GDS menu screens. The engine will now crank to allow any foreign substances to be removed from the cylinders. Once vehicle has performed crank function turn vehicle off.
4. After one minute the "Lost Communication with Vehicle" screen will now be displayed.
5. Install EN-51749 gauge in the spark plug bore for the cylinder that is being checked.
6. Put vehicle into service mode then select OK and then select crank on the GDS menu screens. The engine will now crank and then stop. Turn vehicle off.
7. Record the compression reading for the cylinder just tested.

NOTE: It is important to wait at least one minute with key off between checking each cylinder to ensure the theft deterrent feature is not active and the "lost Communication with Vehicle" screen appears.

8. Repeat starting at step 7 for all remaining cylinders. All 4 cylinders must be tested to obtain valid test results. Record the readings.

Installation Procedure

1. Remove EN-51749 gauge.
2. Install the spark plugs. Refer to [Spark Plug Replacement](#) .
3. Install the ignition coils. Refer to [Ignition Coil Replacement](#) .

CYLINDER LEAKAGE TEST

Special Tools

EN-51749 Compression Gauge Tester Kit

For equivalent regional tools, refer to [Special Tools](#).

NOTE: A leakage test may be performed in order to measure cylinder/combustion chamber leakage. High cylinder leakage may indicate one or more of the following conditions:

- Worn or burnt valves
- Broken valve springs
- Stuck valve lifters
- Incorrect valve lash
- Damaged piston
- Worn piston rings
- Worn or scored cylinder bore
- Damaged cylinder head gasket
- Cracked or damaged cylinder head
- Cracked or damaged engine block

WARNING: Refer to [Battery Disconnect Warning](#) .

1. Disconnect the battery ground negative cable.
2. Remove the spark plugs. Refer to [Spark Plug Replacement](#) .
3. Rotate the crankshaft to place the piston in the cylinder being tested at top dead center (TDC) of the compression stroke.
4. Install the EN-51749 gauge according to the manufacturers instructions.

NOTE: It may be necessary to hold the crankshaft balancer bolt to prevent the crankshaft from rotating.

5. Apply shop air pressure and adjust according to the manufacturers instructions.
6. Record the cylinder leakage value. Cylinder leakage that exceeds 25 percent is considered excessive and may require component service. In excessive leakage situations, inspect for the following conditions:
 - Air leakage noise at the throttle body or air inlet hose that may indicate a worn or burnt intake valve or a broken valve spring.
 - Air leakage noise at the exhaust system tailpipe that may indicate a worn or burnt exhaust valve or a

broken valve spring.

- Air leakage noise from the crankcase, oil level indicator tube, or oil fill tube that may indicate worn piston rings, a damaged piston, a worn or scored cylinder bore, a damaged engine block or a damaged cylinder head.
- Air bubbles in the cooling system may indicate a damaged cylinder head or a damaged cylinder head gasket.

7. Perform the leakage test on the remaining cylinders and record the values.

CRANKCASE VENTILATION SYSTEM INSPECTION/DIAGNOSIS

Symptom	Correction
External oil leak	Inspect for any of the following conditions: • Restricted or kinked PCV hose or engine vent hose • Damaged, incorrect, or incorrectly installed PCV hose • Excessive crankcase pressure
Rough Idle	Inspect for any of the following conditions: • Restricted or kinked PCV hose or engine vent hose • Leaking (damaged) PCV hose • Vacuum hoses worn or not properly installed
Stalling or slow idle speed	Inspect for any of the following conditions: • Restricted or kinked engine vent hose • Leaking (damaged) PCV hose
High idle speed	Inspect for a leaking (damaged) PCV hose
Sludge in the engine	Inspect for restricted or kinked PCV hose or engine vent hose

REPAIR INSTRUCTIONS - ON VEHICLE

CAMSHAFT COVER REPLACEMENT

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)

Fig. 31: Camshaft Cover, Air Cleaner Outlet Duct And Positive Crankcase Ventilation Pipe
Courtesy of GENERAL MOTORS COMPANY

CAUTION: The Positive Crankcase Ventilation (PCV) line is tamper resistant and must always be replaced once it is removed. The fittings connected to the PCV line must also be replaced if they are damaged when the PCV line is removed. To reduce the risk of damage to the fittings, use a suitable cutting tool and carefully cut the connections away.

NOTE: If reinstalling the camshaft cover (3), DO NOT cut the PCV line (1). The air cleaner outlet duct (2), camshaft cover (3) and positive crankcase ventilation pipe (1) should be removed together as shown.

2. If replacing the camshaft cover, remove and discard the positive crankcase ventilation tube. Refer to [Positive Crankcase Ventilation Tube Replacement](#)
3. Remove Fuel Feed Intermediate Pipe. Refer to [Fuel Feed Intermediate Pipe Replacement](#)
4. Remove Fuel Injection Fuel Rail Assembly. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#)

Fig. 32: Bolt, Electrical Connectors, Retainer, Nut And Wiring Harness Bracket
Courtesy of GENERAL MOTORS COMPANY

5. Remove Bolt (1) @ Camshaft Cover
6. Disconnect Electrical Connector (2) @ Exhaust Gas Recirculation Cooler Temperature Sensor
7. Unclip the exhaust gas recirculation cooler temperature sensor from the camshaft cover retainer (3).
8. Disconnect Electrical Connector (5) @ Camshaft Position Actuator Solenoid Valve
9. Remove Nut (7) @ Engine Wiring Harness Bracket (6)
10. Position aside Engine Wiring Harness Bracket (6)

Fig. 33: Bolts, Electrical Connectors, Nut, Fuel Pipe Bracket, Engine Stud, Clip And Engine Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

11. Remove the 3 engine wiring harness support bolts (6, 11)
12. Remove Engine Wiring Harness Bracket Bolt (1)
13. Disconnect Electrical Connector (2) @ Intake Camshaft Position Sensor
14. Remove Nut (4)
15. Lay fuel pipe bracket (3) aside.

16. Remove the engine wiring harness stud (5).
17. Disconnect Electrical Connector (7) @ Exhaust Gas Recirculation Cooler Temperature Sensor
18. Remove the exhaust temperature sensor clip (10).
19. Disconnect Electrical Connector (9) @ Exhaust Camshaft Position Sensor
20. Position aside Engine Wiring Harness (8)

Fig. 34: Electrical Connector And Retainer
Courtesy of GENERAL MOTORS COMPANY

21. Disconnect Electrical Connector (1) @ Camshaft Position Actuator Solenoid Valve
22. Remove Retainer (2)

Fig. 35: Oil Filler Cap And Oil Level Indicator Handle
Courtesy of GENERAL MOTORS COMPANY

23. Remove Oil Filler Cap (1)
24. Remove the oil level indicator handle (2).

Fig. 36: Camshaft Cover, Studs, Bolts And Gaskets
Courtesy of GENERAL MOTORS COMPANY

25. Remove Camshaft Cover Studs (1) (Qty: 2)
26. Remove Camshaft Cover Bolts (4) (Qty: 18)
27. Remove Camshaft Cover (2)
28. Remove and DISCARD the outer camshaft cover gasket (7).
29. Remove and DISCARD the inner camshaft cover gasket (8).
30. Remove and DISCARD the 2 camshaft position actuator solenoid valve gaskets (10).
31. Remove Camshaft Cover Studs (2, 3) (Qty: 2)

Disassemble Procedure

1. Remove Camshaft Position Sensor - Exhaust. Refer to [Camshaft Position Sensor Replacement - Exhaust](#)
2. Remove Camshaft Position Sensor - Intake. Refer to [Camshaft Position Sensor Replacement - Intake](#)
3. Remove Camshaft Position Actuator Solenoid Valve - Intake. Refer to [Camshaft Position Actuator Solenoid Valve Replacement - Intake](#)
4. Remove Camshaft Position Actuator Solenoid Valve - Exhaust. Refer to [Camshaft Position Actuator Solenoid Valve Replacement - Exhaust](#)
5. Remove Positive Crankcase Ventilation Valve - Fresh Air. Refer to [Positive Crankcase Ventilation Valve Replacement - Fresh Air](#)
6. Remove Positive Crankcase Ventilation Valve - Secondary. Refer to [Positive Crankcase Ventilation Valve Replacement - Secondary](#)

Assemble Procedure

1. Install Positive Crankcase Ventilation Valve - Fresh Air. Refer to [Positive Crankcase Ventilation Valve Replacement - Fresh Air](#)
2. Install Positive Crankcase Ventilation Valve - Secondary. Refer to [Positive Crankcase Ventilation Valve Replacement - Secondary](#)
3. Install Camshaft Position Actuator Solenoid Valve - Exhaust. Refer to [Camshaft Position Actuator Solenoid Valve Replacement - Exhaust](#)
4. Install Camshaft Position Actuator Solenoid Valve - Intake. Refer to [Camshaft Position Actuator Solenoid Valve Replacement - Intake](#)

5. Install Camshaft Position Sensor - Intake. Refer to [Camshaft Position Sensor Replacement - Intake](#)
6. Install Camshaft Position Sensor - Exhaust. Refer to [Camshaft Position Sensor Replacement - Exhaust](#)

Installation Procedure

1. Clean all camshaft cover sealing surfaces.

Fig. 37: Camshaft Cover, Studs, Bolts And Gaskets

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

2. Install and tighten Camshaft Cover Studs (2, 3) (Qty: 2) to 10 N.m (89 lb in)

NOTE: Ensure that the gaskets are located in the retaining grooves in the camshaft cover.

3. Apply approximately a 5 mm (0.2 in) thick bead of camshaft cover sealant (11) on both sides between the cylinder head and the engine front cover. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
4. Install 2 NEW camshaft position actuator solenoid valve gaskets (10).
5. Install a NEW camshaft cover inner gasket (8).
6. Install a NEW camshaft cover outer gasket (7).

NOTE: If reinstalling the original camshaft cover, install the camshaft cover, air cleaner outlet duct and positive crankcase ventilation tube as an assembly.

7. Install the camshaft cover (5) along with the pins (6, 9).
8. Hand tighten the 2 camshaft cover double end studs (1).
9. Tighten the Camshaft Cover Bolts (4) (Qty: 18) bolts by hand.

Fig. 38: Camshaft Cover Stud And Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

10. Tighten the 2 camshaft cover double end studs (1) and the 18 camshaft cover bolts (2) in sequence as shown to 15 N.m (11 lb ft).

Fig. 39: Oil Filler Cap And Oil Level Indicator Handle
Courtesy of GENERAL MOTORS COMPANY

11. Install the oil level indicator handle (2).
12. Install Oil Filler Cap (1)

Fig. 40: Electrical Connector And Retainer
Courtesy of GENERAL MOTORS COMPANY

13. Connect Electrical Connector (1) @ Camshaft Position Actuator Solenoid Valve
14. Install Retainer (2)

Fig. 41: Bolts, Electrical Connectors, Nut, Fuel Pipe Bracket, Engine Stud, Clip And Engine Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

15. Position the engine wiring harness (8).
16. Connect Electrical Connector (9) @ Exhaust Camshaft Position Sensor
17. Install the exhaust temperature sensor clip (10).
18. Connect Electrical Connector (7) @ Exhaust Gas Recirculation Cooler Temperature Sensor
19. Install the engine wiring harness stud (5) and tighten to 9 N.m (80 lb in).
20. Install fuel pipe bracket (3).
21. Install and tighten Nut (4) to 9 N.m (80 lb in)
22. Install the 3 engine wiring harness support bolts (6, 11) and tighten to 9 N.m (80 lb in).
23. Install and tighten Engine Wiring Harness Bracket Bolt (1) to 9 N.m (80 lb in)

24. Connect Electrical Connector (2) @ Intake Camshaft Position Sensor

Fig. 42: Bolt, Electrical Connectors, Retainer, Nut And Wiring Harness Bracket
Courtesy of GENERAL MOTORS COMPANY

25. Install the engine wiring harness bracket (6).
26. Connect Electrical Connector (2) @ Exhaust Gas Recirculation Cooler Temperature Sensor
27. Clip in exhaust gas recirculation cooler temperature sensor to the camshaft cover retainer (3).
28. Connect Electrical Connector (5) @ Camshaft Position Actuator Solenoid Valve
29. Install and tighten Nut (7) @ Engine Wiring Harness Bracket (6) to 9 N.m (80 lb in)
30. Install and tighten Bolt (1) @ Camshaft Cover to 9 N.m (80 lb in)
31. Install Positive Crankcase Ventilation Tube. Refer to [Positive Crankcase Ventilation Tube Replacement](#)
32. Install Fuel Injection Fuel Rail Assembly. Refer to [Fuel Injection Fuel Rail Assembly Replacement](#)
33. Install Fuel Feed Intermediate Pipe. Refer to [Fuel Feed Intermediate Pipe Replacement](#)
34. Enable high voltage system. Refer to [High Voltage Enabling](#)

CAMSHAFT POSITION ACTUATOR REPLACEMENT

Special Tools

- **EN-45059** Angle Meter
- **EN-51367** Camshaft Holder
- **EN-51397-1** Timing Chain Retainer
- **EN-51397-2** Timing Chain Retainer

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)
2. Drain the cooling system. Refer to [Cooling System Draining and Filling](#) -
3. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
4. Remove Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)

Fig. 43: Heater Coolant Heater, Heater Inlet Hose And Quick Connect
Courtesy of GENERAL MOTORS COMPANY

5. Disconnect Heater Inlet Hose Quick Connect (2) @ Heater Inlet Hose (3)
6. Disconnect Heater Inlet Hose (3) @ Heater Coolant Heater (1)
7. Remove Heater Inlet Hose (3)

Fig. 44: Crankshaft Balancer Markings
Courtesy of GENERAL MOTORS COMPANY

8. Adjust the engine to cylinder 1 top dead center (TDC) of combustion stroke. Set crankshaft in direction of engine rotation until the markings (1, 2) line up. Rotate at the crankshaft balancer bolt (3).
9. Lower the vehicle.

Fig. 45: Camshaft Holder

Courtesy of GENERAL MOTORS COMPANY

10. Install the EN-51367 holder (1).
11. Remove Timing Chain Upper Guide. Refer to [Timing Chain Upper Guide Replacement](#)

Fig. 46: Camshaft Position Actuator Marks And Timing Chain Marks

Courtesy of GENERAL MOTORS COMPANY

NOTE: The actuator marks stands at 12 o'clock, if the cylinder 1 are on top dead center.

12. Check camshaft position actuator marks (1).
13. Apply a color marking to the camshaft timing chain (1) marking to corresponding timing chain link.

Fig. 47: Camshaft Timing Chain, Retainers, Thumb Wheels And Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Pre-Install the **EN-51397-2** retainer (2) to the intake side of the camshaft timing chain (3).
15. Install the **EN-51397-1** retainer (5) to the exhaust side of the camshaft timing chain.
16. Hand tighten the thumb wheels (1, 4) securely.

CAUTION: Refer to **Fastener Caution**

17. Tighten Bolts (6) (Qty: 2) to 5 N.m (44 lb in)

Fig. 48: Camshaft Position Actuator Bolts
Courtesy of GENERAL MOTORS COMPANY

18. Loosen Bolts (1) (Qty: 2) @ Camshaft Position Actuator
19. Remove the **EN-51367** holder.

Fig. 49: Engine Front Cover, Hole Plug And Seal Ring
Courtesy of GENERAL MOTORS COMPANY

20. Remove Engine Front Cover Hole Plug (1) @ Engine Front Cover
21. Remove Seal Ring (2)

Fig. 50: Releasing Tension From Piston
Courtesy of GENERAL MOTORS COMPANY

NOTE: Step 22 - 26 explain how to adjust and fix the timing chain tensioner in the service position and should be used for reference.

22. Slightly release tension from the piston (2) until bar (1) can be unlocked by rotating the lever (3) in direction of arrow.

Fig. 51: Piston And Tensioner Lever
Courtesy of GENERAL MOTORS COMPANY

23. Entirely push back the piston (1) until the tensioner Lever (2) cannot be locked in this position.

Fig. 52: Piston
Courtesy of GENERAL MOTORS COMPANY

24. Release tension from the piston (1) until it releases for three ratchets. The three ratchets can be noticed by the click noises.

Fig. 53: Lever And Fixing Pin

Courtesy of GENERAL MOTORS COMPANY

25. Apply tension to the piston until the lever (1) is rotated back into the locking position where the bore in the lever aligns with the bore in the tensioner housing.
26. Fix the lever in this position with a suitable fixing pin (2).

Fig. 54: Wrench On Camshaft

Courtesy of GENERAL MOTORS COMPANY

CAUTION: The tightening force must be applied gently to the wrench. Using too much force will lead to an overlap of the timing chain that will cause severe engine damages.

NOTE: A second technician is required.

Follow Step 22 - 26 during rotation of the intake camshaft

27. Install a suitable wrench (1) to the intake camshaft.
28. Apply tension to the chain tensioner by slightly rotating the intake camshaft clockwise.

Fig. 55: Timing Chain Tensioner In Lock Position
 Courtesy of GENERAL MOTORS COMPANY

NOTE: The timing chain tensioner has now the lock position (1).

29. Secure the timing chain tensioner design 1 with a suitable fixing pin 3 mm (0.118 in).

Fig. 56: Bolt And Retainer
 Courtesy of GENERAL MOTORS COMPANY

30. Fix the **EN-51397-2** retainer (1) to the intake side of the camshaft timing chain.

31. Tighten the bolt (2) of the **EN-51397-2** retainer to 5 N.m (44 lb in).

32. Remove the wrench.

Fig. 57: Checking Chain Slack

Courtesy of GENERAL MOTORS COMPANY

NOTE: The timing chain can be moved up and down between both camshaft position actuators.

33. Check chain slack, if not enough slack is gained, refer to detailed chain tensioner description from step 22 to 26. Apply and release tension to the chain tensioner.

Fig. 58: Intake Camshaft Position Actuator And Bolt

Courtesy of GENERAL MOTORS COMPANY

NOTE: Only if the timing chain tensioner is fixed in the service position as described above, the timing chain is properly free from tension. Removing the camshaft actuator in another position of the tensioner will make the reinstallation impossible and removal of the engine front cover will be required.

34. Remove and DISCARD the intake camshaft position actuator bolt (1).

NOTE: The camshaft timing chain will be hold by EN-51397-1 retainer.

35. Remove the intake camshaft position actuator (2).

Fig. 59: Exhaust Camshaft Position Actuator And Bolt
Courtesy of GENERAL MOTORS COMPANY

36. Remove and DISCARD the exhaust camshaft position actuator bolt (1).

NOTE: The camshaft timing chain will be hold by EN-51397-1 retainer.

37. Remove the exhaust camshaft position actuator (2).

Installation Procedure

Fig. 60: Camshaft Position Actuator Marks And Timing Chain Marks
Courtesy of GENERAL MOTORS COMPANY

1. The marks of the camshaft position actuators (2) must be set to the marks of the camshaft timing chain (1).

Fig. 61: Exhaust Camshaft Position Actuator, Dowel Pin, Camshaft And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Install the exhaust camshaft position actuator (1).
3. Readjust the camshaft until the dowel pin (2) engage to camshaft (3).

Fig. 62: Intake Camshaft Position Actuator, Dowel Pin, Camshaft And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install the exhaust camshaft position actuator (1).
5. Readjust the camshaft until the dowel pin (2) engage to camshaft (3).

NOTE: **Counterhold the camshaft with a suitable tool.**

6. Install the intake camshaft position actuator bolt (4) but do not tighten yet.

Fig. 63: Camshaft Holder

Courtesy of GENERAL MOTORS COMPANY

7. Install the EN-51367 holder (1).

Fig. 64: Camshaft Position Actuator Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

NOTE: Counterhold the camshaft with a suitable tool.

8. Tighten the 2 to camshaft position actuator bolts (1) to:
 1. First Pass: 20 N.m (15 lb ft).
 2. Final Pass: 90 degrees use the EN-45059 meter.
9. Remove the EN-51367 holder (1).

Fig. 65: Camshaft Timing Chain, Retainers, Thumb Wheels And Bolts
Courtesy of GENERAL MOTORS COMPANY

10. Loosen the bolts. (6) (Qty: 2)
11. Loosen the bolts. (1, 4) (Qty: 2)
12. Remove **EN-51397-2** retainer (2).
13. Remove **EN-51397-1** retainer (5).

Fig. 66: Timing Chain Tensioner In Lock Position
Courtesy of GENERAL MOTORS COMPANY

NOTE: The following step shows the tensioner design 1.

14. Remove the pin from the timing chain tensioner (1).
15. Install Timing Chain Upper Guide. Refer to [**Timing Chain Upper Guide Replacement**](#)
16. Check the position of the crankshaft, camshaft and camshaft position actuator.

Fig. 67: Crankshaft Balancer Markings
Courtesy of GENERAL MOTORS COMPANY

17. Turn crankshaft 720 degrees in the direction of engine rotation by the crankshaft balancer bolt (3).
18. Adjust the engine to cylinder 1 TDC of combustion stroke. Set crankshaft in direction of engine rotation until the markings (1, 2) line up. Rotate at the crankshaft balancer bolt (3).

Fig. 68: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

19. Install the **EN-51367** holder (1).
20. If the **EN-51367** holder (1) can be installed, the engine timing is properly adjusted.

Fig. 69: Engine Front Cover, Hole Plug And Seal Ring
Courtesy of GENERAL MOTORS COMPANY

21. Install Seal Ring (2)
22. Install and tighten Engine Front Cover Hole Plug (1) to 50 N.m (37 lb ft)
23. Raise the vehicle.

Fig. 70: Heater Coolant Heater, Heater Inlet Hose And Quick Connect
Courtesy of GENERAL MOTORS COMPANY

24. Install Heater Inlet Hose (3) @ Heater Coolant Heater (1)
25. Connect Heater Inlet Hose Quick Connect (2) @ Heater Inlet Hose (3)
26. Install Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
27. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
28. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)
29. Install Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)

EXHAUST CAMSHAFT REPLACEMENT

Removal Procedure

1. Remove Camshaft Position Actuator. Refer to [Camshaft Position Actuator Replacement](#)

Fig. 71: Exhaust Camshaft, Bearing Caps And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces.

2. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.
3. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.
4. Loosen the 12 camshaft bearing cap bolts (1, 2, 7, 8), working from outside to inside in a spiral in steps of 1/2 turn.

NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location.

5. Remove the 12 camshaft bearing cap bolts (1, 2, 7, 8).
6. Remove Camshaft Bearing Cap (3, 4, 6) (Qty: 6) @ Cylinder Head Assembly
7. Remove Exhaust Camshaft (5)

Fig. 72: Exhaust Camshaft, Bearing Caps And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Coat the intake camshaft with lubricant. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
2. Install Exhaust Camshaft (5)
3. Ensure that the camshaft notch at the front of the camshaft is in the 12 o'clock position before installing the camshaft caps.
4. Rotate the oil seal in the groove of the number one camshaft journal so the split line is at approximately the 12 o'clock position before installing the camshaft caps.

NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. Ensure the caps are installed in the original location and position.

5. Lubricate the 6 camshaft bearing caps (3, 4, 6) and the 12 camshaft bearing cap bolts (1, 2, 7, 8). Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
6. Install Camshaft Bearing Caps (4) (Qty: 4)
7. Install the camshaft bearing rear cap (3).

8. Install the camshaft bearing front cap (6).
9. Loosely install the 12 camshaft bearing cap bolts (1, 2, 7, 8).

Fig. 73: Exhaust Camshaft Bearing Cap Bolt Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

10. Tighten the camshaft bearing cap bolts (1, 2, 7, 8) in increments of 3 turns until they are seated.
11. Tighten the bearing cap bolts in sequence as shown to 12 N.m (106 lb in).
12. Install Camshaft Position Actuator. Refer to [Camshaft Position Actuator Replacement](#)

INTAKE CAMSHAFT REPLACEMENT

Removal Procedure

1. Remove Camshaft Position Actuator. Refer to [Camshaft Position Actuator Replacement](#)
2. Remove Fuel Injection Pump. Refer to [Fuel Injection Pump Replacement](#)

Fig. 74: Intake Camshaft, Bearing Caps And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces.

3. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.
4. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.
5. Loosen the 12 camshaft bearing cap bolts (1, 2, 7, 8), working from outside to inside in a spiral in steps of 1/2 turn.

NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location.

6. Remove the 12 camshaft bearing cap bolts (1, 2, 7, 8).
7. Remove Camshaft Bearing Caps (3, 4, 6) (Qty: 6) @ Cylinder Head Assembly
8. Remove Intake Camshaft (5)

Installation Procedure

Fig. 75: Intake Camshaft, Bearing Caps And Bolts
 Courtesy of GENERAL MOTORS COMPANY

1. Coat the intake camshaft with lubricant. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
2. Install Intake Camshaft (5)
3. Ensure that the camshaft notch at the front of the camshaft is in the 12 o'clock position before installing the camshaft caps.
4. Rotate the oil seal in the groove of the number one camshaft journal so the split line is at approximately the 12 o'clock position before installing the camshaft caps.

NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. Ensure the caps are installed in the original location and position.

5. Lubricate the 6 camshaft bearing caps (3, 4, 6) and the 12 camshaft bearing cap bolts (1, 2, 7, 8). Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
6. Install the 4 camshaft bearing caps (4).
7. Install the camshaft bearing rear cap (3).
8. Install the camshaft bearing front cap (6).
9. Loosely install the 12 camshaft bearing cap bolts (1, 2, 7, 8).

Fig. 76: Intake Camshaft Bearing Cap Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

10. Tighten the camshaft bearing cap bolts (1, 2, 7, 8) in increments of 3 turns until they are seated.
11. Tighten the bearing cap bolts in sequence as shown to 12 N.m (106 lb in).
12. Install Fuel Injection Pump. Refer to [Fuel Injection Pump Replacement](#)
13. Install Camshaft Position Actuator. Refer to [Camshaft Position Actuator Replacement](#)

CAMSHAFT TIMING CHAIN REPLACEMENT

Special Tools

EN-51367 Camshaft Holder

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Drain the cooling system. Refer to [Cooling System Draining and Filling](#)
2. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)

11. Remove Timing Chain Tensioner Shoe Bolt (1)
12. Remove Timing Chain Tensioner Shoe (2)

Fig. 86: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

13. Ensure the correct fixation of the tool (3).
14. Remove Timing Chain Tensioner Bolts (4) (Qty: 2)
15. Remove Timing Chain Tensioner (1)
16. Remove and DISCARD the gasket. (2)

Fig. 87: Timing Chain

Courtesy of GENERAL MOTORS COMPANY

17. Remove Timing Chain (1)

Installation Procedure

Fig. 88: Timing Chain

Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the actuator timing marks are approximately the 12 o'clock position.

1. Install Timing Chain (1) - Install

Fig. 89: Timing Chain Marks

Courtesy of GENERAL MOTORS COMPANY

2. Ensure that the colored link (3) matches to the arrow on the crankshaft sprocket.
3. Ensure that the colored links (1, 2) match to the marks on the camshaft position adjuster actuators.

Fig. 90: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket

Courtesy of GENERAL MOTORS COMPANY

4. Install a NEW gasket. (2)
5. Install Timing Chain Tensioner (1)

CAUTION: Refer to **Fastener Caution**

6. Install and tighten Timing Chain Tensioner Bolts (4) (Qty: 2) to 25 N.m (18 lb ft)

7. Remove the suitable tool (3) from the timing chain tensioner.

Fig. 91: Timing Chain Tensioner Shoe And Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Install Timing Chain Tensioner Shoe (2)

9. Install and tighten Timing Chain Tensioner Shoe Bolt (1) to 25 N.m (18 lb ft)

Fig. 92: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

10. Remove the **EN-51367** holder (1).

11. Install Timing Chain Upper Guide. Refer to [Timing Chain Upper Guide Replacement](#)

12. Check the position of the crankshaft, camshaft and camshaft position actuator adjuster.

1. Install the engine front cover with 4 bolts and the crankshaft balancer.

Fig. 93: Crankshaft Balancer Markings
Courtesy of GENERAL MOTORS COMPANY

2. Turn crankshaft 720 degrees in the direction of engine rotation by the crankshaft balancer bolt (2).

Fig. 94: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

13. Install the **EN-51367** holder (1).
14. If the **EN-51367** holder (1) can be installed, the engine timing is properly adjusted.
15. Remove the **EN-51367** holder.
16. Remove the engine front cover and crankshaft balancer.

Fig. 95: Heater Coolant Heater, Heater Inlet Hose And Quick Connect
Courtesy of GENERAL MOTORS COMPANY

17. Install Heater Inlet Hose (3) @ Heater Coolant Heater (1)
18. Connect Heater Inlet Hose Quick Connect (2) @ Heater Inlet Hose (3)
19. Install Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
20. Install Engine Front Cover. Refer to [Engine Front Cover Replacement](#)
21. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
22. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)

TIMING CHAIN OIL NOZZLE REPLACEMENT

Fig. 96: Timing Chain Oil Nozzle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Timing Chain Guide - Right Side. Refer to Timing Chain Guide Replacement - Right Side	
1	Timing Chain Oil Nozzle CAUTION: Refer to Fastener Caution . Tighten 15 N.m (11 lb ft)

HYDRAULIC VALVE LASH ADJUSTER ARM REPLACEMENT

Removal Procedure

1. Remove Intake Camshaft. Refer to [Intake Camshaft Replacement](#)
2. Remove Exhaust Camshaft. Refer to [Exhaust Camshaft Replacement](#)

Fig. 97: Hydraulic Valve Lash Adjuster Arms
Courtesy of GENERAL MOTORS COMPANY

NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces.

3. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.
4. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.
5. Remove Hydraulic Valve Lash Adjuster Arms (1) (Qty: 16)

Installation Procedure

Fig. 98: Hydraulic Valve Lash Adjuster Arms
Courtesy of GENERAL MOTORS COMPANY

NOTE: Used lash adjuster arms must be returned to the original position on the camshaft. If the camshaft is being replaced, the lash adjuster arms actuated by the camshaft must also be replaced.

1. Apply lubricant to the valve tips. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
2. Position the 16 hydraulic lash adjuster arms (1) on the tip of the valve stems and on the lash adjusters.
3. Apply lubricant to the 16 hydraulic lash adjuster arms (1). Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
4. Install Exhaust Camshaft. Refer to [Exhaust Camshaft Replacement](#)
5. Install Intake Camshaft. Refer to [Intake Camshaft Replacement](#)

HYDRAULIC VALVE LASH ADJUSTER REPLACEMENT

Removal Procedure

1. Remove Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)

Fig. 99: Hydraulic Valve Lash Adjusters

Courtesy of GENERAL MOTORS COMPANY

NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces.

2. Components **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.
3. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.
4. Remove the 16 hydraulic valve lash adjusters (1).

Installation Procedure

Fig. 100: Hydraulic Valve Lash Adjusters
Courtesy of GENERAL MOTORS COMPANY

1. Install the 16 hydraulic valve lash adjusters (1) in the bores in the cylinder head.
2. Apply lubricant to the 16 hydraulic valve lash adjusters (1). Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
3. Install Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)

VALVE STEM OIL SEAL AND VALVE SPRING REPLACEMENT

Special Tools

- EN-46116 Valve Stem Seal Remover
- EN-50717 Universal Valve Spring Compressor Kit
- EN-51511 Injector Port Service Plug

Equivalent regional tools: [Special Tools](#).

Removal Procedure

1. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
2. Remove Spark Plugs (Qty: 4). Refer to [Spark Plug Replacement](#)

3. Remove Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)

Fig. 101: Injector Port Service Plug

Courtesy of GENERAL MOTORS COMPANY

4. Install the **EN-51511** Plug (2) into the injector bore to prevent air leaks in the cylinder.

5. Tighten Bolt (1)

Fig. 102: Valve Spring Compressor Kit, Cross Bars And Locks

Courtesy of GENERAL MOTORS COMPANY

6. Install the **EN-50717** compressor kit (1) to the front and rear of the cylinder head as shown.

7. Install the cross bars and locks (2) of the **EN-50717** compressor kit to the valve spring compressor adapters.

8. Install an air hose adapter into the spark plug hole.

9. Position the **EN-50717-2** compressor (3) so that its adapter proper contacts the valve spring retainer and pretension the compressor.

Fig. 103: Valve Spring, Retainer And Valve Key
Courtesy of GENERAL MOTORS COMPANY

WARNING: Valve springs can be tightly compressed. Use care when removing the retainers and plugs. Personal injury could result.

10. Apply pressure to the **EN-50717-2** compressor to push down the valve spring retainer (2) and compress the valve spring (3) until the valve keys (1) are free from tension.
11. Carefully remove the valve keys then.
12. Release the tension from the **EN-50717-2** compressor.

Fig. 104: Valve Spring And Retainer
Courtesy of GENERAL MOTORS COMPANY

13. Remove the valve spring retainer (1) and the exhaust valve spring or intake valve spring (2).

Fig. 105: Valve Stem Oil Seal And Special Tool
Courtesy of GENERAL MOTORS COMPANY

14. Remove and DISCARD the valve stem oil seal (2). Use the **EN-46116** remover (1).

Installation Procedure

Fig. 106: Valve Stem Oil Seal And Special Tool
Courtesy of GENERAL MOTORS COMPANY

NOTE: Valve stem oil seal sets will contain 2 different colored seals, black and green. The set of 8 seals that are green have to installed to the exhaust valves.

1. Install NEW valve stem oil seal (2). Use the **EN-46116** installer (1).

Fig. 107: Valve Spring And Retainer
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Make sure that the valve springs and the valve spring retainers will be installed in their original position.

2. Install the exhaust or the intake valve spring (2) and the upper valve spring retainer (1). Which valve spring is to be installed, depends on the installation progress.

Fig. 108: Valve Spring, Retainer And Valve Key
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: The valve stem keys must correctly seat in the valve spring cap. Engine damage may occur by not installing properly.

3. Using the **EN-50717-2** compressor, push down the valve spring retainer (2) and compress the valve spring (3) until the valve keys (1) can be inserted. Carefully insert the valve keys then, so that they are proper installed to the valve stem grooves.
4. Carefully release the tension from the **EN-50717-2** compressor.
5. Inspect the valve keys and valve spring retainer for proper seat.

Fig. 109: Valve Spring Compressor Kit, Cross Bars And Locks
Courtesy of GENERAL MOTORS COMPANY

6. Repeat the procedure with the remaining valves and cylinders.
7. Transfer the **EN-50717** compressor kit (1, 2, 3) and the **EN-51511** plug as needed.
8. Take care that air pressure is always applied to the combustion chamber of the treated cylinder.
9. Remove **EN-50717** compressor kit from the cylinder head.

Fig. 110: Injector Port Service Plug
Courtesy of GENERAL MOTORS COMPANY

10. Loosen the bolt. (1)
11. Remove the **EN-51511** plug (2) from the injector bores.
12. Install Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)

- 13. Install Spark Plugs (Qty: 4). Refer to [Spark Plug Replacement](#)
- 14. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)

POSITIVE CRANKCASE VENTILATION TUBE REPLACEMENT

Fig. 111: Positive Crankcase Ventilation Tube
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Intake Manifold Cover. Refer to Intake Manifold Cover Replacement	
1	Positive Crankcase Ventilation Tube CAUTION: The Positive Crankcase Ventilation (PCV) line is tamper resistant and must always be replaced once it is removed. The fittings connected to the PCV line must also be replaced if they are

Callout	Component Name
	damaged when the PCV line is removed. To reduce the risk of damage to the fittings, use a suitable cutting tool and carefully cut the connections away. Procedure Using a suitable cutting tool, carefully cut the PCV tube away from the fittings at the air cleaner outlet duct and the camshaft cover. If any damage occurs to either the air cleaner outlet duct or camshaft cover fitting, they must be replaced. Refer to Air Cleaner Outlet Duct Replacement

POSITIVE CRANKCASE VENTILATION VALVE REPLACEMENT - FRESH AIR

Special Tools

EN-50956 Tamper Proof Drive Bit

Equivalent regional tools: [Special Tools](#)

Removal Procedure

Fig. 112: Positive Crankcase Ventilation Valve, Tube And Bolt

Courtesy of GENERAL MOTORS COMPANY

1. Remove and DISCARD Positive Crankcase Ventilation Tube (2). Refer to [Positive Crankcase Ventilation Tube Replacement](#)
2. Using a suitable tool, cut a slot in the tamper-resistant positive crankcase ventilation fresh air bolt head (1) and remove with a flat-bladed tool. DISCARD the bolt.
3. Remove Positive Crankcase Ventilation Valve (3)

Installation Procedure

Fig. 113: Positive Crankcase Ventilation Valve, Tube, Bolt And Special Tool

Courtesy of GENERAL MOTORS COMPANY

1. Install Positive Crankcase Ventilation Valve (4)

CAUTION: Refer to [Fastener Caution](#)

2. Install the NEW positive crankcase ventilation valve fresh air bolt (1) using EN-50956 bit (2), and tighten to 10 N.m (89 lb in).

NOTE: Install a new tube.

3. Install NEW Positive Crankcase Ventilation Tube (3). Refer to [Positive Crankcase Ventilation Tube Replacement](#)

POSITIVE CRANKCASE VENTILATION VALVE REPLACEMENT - SECONDARY

Special Tools

EN-50956 Tamper Proof Drive Bit

Equivalent regional tools: [Special Tools](#)

Removal Procedure

Fig. 114: Positive Crankcase Ventilation Valve, Tube And Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Remove and DISCARD Positive Crankcase Ventilation Tube (3). Refer to [Positive Crankcase Ventilation Tube Replacement](#)
2. Using a suitable tool, cut a slot in the tamper-resistant positive crankcase ventilation fresh air bolt head (1) and remove with a flat-bladed tool. DISCARD the bolt.
3. Remove Positive Crankcase Ventilation Valve (2)

Installation Procedure

Fig. 115: Positive Crankcase Ventilation Valve, Tube, Bolt And Special Tool
Courtesy of GENERAL MOTORS COMPANY

1. Install Positive Crankcase Ventilation Valve (2)

CAUTION: Refer to [Fastener Caution](#)

2. Install the NEW positive crankcase ventilation valve fresh air bolt (1) using **EN-50956** bit (4), and tighten to 10 N.m (89 lb in).

NOTE: Install a new tube.

3. Install NEW Positive Crankcase Ventilation Tube (3). Refer to [Positive Crankcase Ventilation Tube Replacement](#)

TIMING CHAIN UPPER GUIDE REPLACEMENT

Fig. 116: Timing Chain Upper Guide

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Camshaft Cover. Refer to Camshaft Cover Replacement	
1	Timing Chain Guide Fastener (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)

Callout	Component Name
2	Upper Timing Chain Guide

TIMING CHAIN GUIDE REPLACEMENT - RIGHT SIDE

Removal Procedure

1. Remove Camshaft Timing Chain. Refer to [Camshaft Timing Chain Replacement](#)

Fig. 117: Right Side Timing Chain Guide And Bolts
 Courtesy of GENERAL MOTORS COMPANY

2. Remove the 3 timing chain guide bolts (2).
3. Remove the timing chain guide - right side (1).

Installation Procedure

Fig. 118: Right Side Timing Chain Guide And Bolts
 Courtesy of GENERAL MOTORS COMPANY

1. Install the timing chain guide - right side (1).

CAUTION: Refer to [Fastener Caution](#) .

2. Install the 3 timing chain guide bolts (2) and tighten to 10 N.m (89 lb in).
3. Install Camshaft Timing Chain. Refer to [Camshaft Timing Chain Replacement](#)

TIMING CHAIN TENSIONER REPLACEMENT

Special Tools

EN-51367 Camshaft Holder

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)

Fig. 119: Crankshaft Balancer Markings

Courtesy of GENERAL MOTORS COMPANY

2. Adjust the engine to cylinder 1 top dead center (TDC) of combustion stroke. Set crankshaft in direction of engine rotation until the markings (1, 2) line up. Rotate at the crankshaft balancer bolt (3).

Fig. 120: Camshaft Holder

Courtesy of GENERAL MOTORS COMPANY

3. Install the EN-51367 holder (1).
4. Remove Engine Front Cover. Refer to [Engine Front Cover Replacement](#)
5. Remove Timing Chain Upper Guide. Refer to [Timing Chain Upper Guide Replacement](#)

Fig. 121: Timing Chain Tensioner In Service Position

Courtesy of GENERAL MOTORS COMPANY

6. Fix the timing chain tensioner with design 1 (1) in service position:

Fig. 122: Releasing Tension From Piston

Courtesy of GENERAL MOTORS COMPANY

1. Slightly release tension from the piston (2) until bar (1) can be unlocked by rotating the lever (3) in direction of arrow.

Fig. 123: Piston And Tensioner Lever
Courtesy of GENERAL MOTORS COMPANY

2. Entirely push back the piston (1) until the tensioner lever (2) cannot be locked in this position.

Fig. 124: Piston
Courtesy of GENERAL MOTORS COMPANY

3. Release tension from the piston (1) until it releases for three ratchets. The three ratchets can be noticed by the click noises.

Fig. 125: Lever And Fixing Pin

Courtesy of GENERAL MOTORS COMPANY

4. Apply tension to the piston until the lever (1) is rotated back into the locking position where the bore in the lever aligns with the bore in the tensioner housing.
5. Fix the lever in this position with a suitable fixing pin (2).

Fig. 126: Timing Chain Tensioner Shoe And Bolt

Courtesy of GENERAL MOTORS COMPANY

7. Remove Timing Chain Tensioner Shoe Bolt (1)
8. Remove Timing Chain Tensioner Shoe (2)

Fig. 127: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

9. Ensure the correct fixation of the tool (3).
10. Remove Timing Chain Tensioner Bolts (4) (Qty: 2)
11. Remove Timing Chain Tensioner (1)
12. Remove and DISCARD the gasket. (2)

Installation Procedure

Fig. 128: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW gasket. (2)
2. Install Timing Chain Tensioner (1)

CAUTION: Fastener Caution

3. Install and tighten Timing Chain Tensioner Bolts (4) (Qty:) to 25 N.m (18 lb ft)

Fig. 129: Timing Chain Tensioner Shoe And Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install Timing Chain Tensioner Shoe (2)
5. Install and tighten Timing Chain Tensioner Shoe Bolt (1) to 25 N.m (18 lb ft)
6. Remove the suitable tool from the timing chain tensioner.

Fig. 130: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

7. Remove the EN-51367 holder (1).
8. Install Timing Chain Upper Guide. Refer to [**Timing Chain Upper Guide Replacement**](#)
9. Check the position of the crankshaft, camshaft and camshaft position actuator adjuster:
 1. Install the engine front cover with 4 bolts and the crankshaft balancer.

Fig. 131: Crankshaft Balancer Markings
Courtesy of GENERAL MOTORS COMPANY

2. Turn crankshaft 720 degrees in the direction of engine rotation by the crankshaft balancer bolt (3).

Fig. 132: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

10. Install the **EN-51367** holder (1).
11. If the **EN-51367** holder (1) can be installed, the engine timing is properly adjusted.
12. Remove the **EN-51367** holder.
13. Remove the engine front cover and crankshaft balancer.
14. Install Engine Front Cover. Refer to [Engine Front Cover Replacement](#)
15. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)

TIMING CHAIN TENSIONER SHOE REPLACEMENT

Removal Procedure

1. Release tension from the timing chain tensioner. Refer to [Timing Chain Tensioner Replacement](#).

Fig. 133: Timing Chain Tensioner Shoe And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Remove Timing Chain Tensioner Shoe Bolt (1)
3. Remove Timing Chain Tensioner Shoe (2)

Installation Procedure

Fig. 134: Timing Chain Tensioner Shoe And Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install Timing Chain Tensioner Shoe (2)

CAUTION: Refer to [Fastener Caution](#) .

2. Install and tighten Timing Chain Tensioner Shoe Bolt (1) to 25 N.m (18 lb ft)
3. Unlock the timing chain tensioner. Refer to [Timing Chain Tensioner Replacement](#).

INTAKE MANIFOLD COVER REPLACEMENT

Fig. 135: Intake Manifold Cover
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Upper Intake Manifold Cover Bolt CAUTION: Refer to Fastener Caution Tighten 10 N.m (89 lb in)
2	Engine Oil Filler Cap
3	Upper Intake Manifold Cover Procedure Release the upper intake manifold cover retainers by pulling the upper intake manifold cover upwards.

UPPER INTAKE MANIFOLD COVER REPLACEMENT

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Dash Upper Extension Panel Opening Cover. Refer to [Dash Upper Extension Panel Opening Cover Replacement](#)
3. Remove Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
4. Remove Exhaust Gas Recirculation Pipe. Refer to [Exhaust Gas Recirculation Pipe Replacement](#)

Fig. 136: Upper Intake Manifold Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove Upper Intake Manifold Cover Bolts (2) (Qty: 3)
6. Remove Upper Intake Manifold Cover (1)

Installation Procedure

Fig. 137: Upper Intake Manifold Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Upper Intake Manifold Cover (1)

CAUTION: Refer to [Fastener Caution](#)

2. Install and tighten Upper Intake Manifold Cover Bolts (2) (Qty: 3) to 2.5 N.m (22 lb in)
3. Install Exhaust Gas Recirculation Pipe. Refer to [Exhaust Gas Recirculation Pipe Replacement](#)
4. Install Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
5. Install Dash Upper Extension Panel Opening Cover. Refer to [Dash Upper Extension Panel Opening Cover Replacement](#)
6. Enable the high voltage system. Refer to [High Voltage Enabling](#)

LOWER INTAKE MANIFOLD COVER REPLACEMENT

Removal Procedure

1. Remove Intake Manifold. Refer to [Intake Manifold Replacement](#)

Fig. 138: Lower Intake Manifold Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Remove Upper Intake Manifold Cover Bolts (1) (Qty: 3)
3. Remove Lower Intake Manifold Cover (2)

Installation Procedure

Fig. 139: Lower Intake Manifold Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Lower Intake Manifold Cover (2)

CAUTION: Refer to **Fastener Caution**

2. Install and tighten Upper Intake Manifold Cover Bolts (1) (Qty: 3) to 2.5 N.m (22 lb in)
3. Install Intake Manifold. Refer to [Intake Manifold Replacement](#)

INTAKE MANIFOLD REPLACEMENT

Special Tools

EN-6015 Closure Plugs

Equivalent regional tools: [Special Tools \(Diagnostic Tools\)](#) [Special Tools \(Repair Tools\)](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Dash Upper Extension Panel Opening Cover. Refer to [Dash Upper Extension Panel Opening Cover Replacement](#)
3. Remove Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
4. Remove Evaporative Emission Canister Purge Solenoid Valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#)
5. Remove Throttle Body Assembly. Refer to [Throttle Body Assembly Replacement](#)
6. Remove Manifold Absolute Pressure Sensor. Refer to [Manifold Absolute Pressure Sensor Replacement](#)
7. Remove Exhaust Gas Recirculation Pipe. Refer to [Exhaust Gas Recirculation Pipe Replacement](#)

Fig. 140: Fuel Feed Front Pipe And Fuel Injection Pump

Courtesy of GENERAL MOTORS COMPANY

8. Disconnect Fuel Feed Front Pipe (2) @ Fuel Injection Pump (1)
9. Close all open connections with the **EN-6015** plugs.

Fig. 141: Air Cleaner Resonator Bracket, Retainers And Bolt

Courtesy of GENERAL MOTORS COMPANY

10. Unclip Retainers (1) (Qty: 2)
11. Remove Bolt (3)
12. Remove the air cleaner resonator bracket (2).

Fig. 142: A/C High Pressure Cutoff Switch, Electrical Connector, Retainer And Engine Wiring Harness

Courtesy of GENERAL MOTORS COMPANY

13. Disconnect the electrical connector (2) from the air conditioning high pressure cutoff switch (1).
14. Unclip Retainer (3)
15. Position aside Engine Wiring Harness (4)

Fig. 143: Intake Manifold And Bolts
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Keep the fasteners in position on the assembly.

16. Loosen Bolts (2) (Qty: 5) @ Intake Manifold (1)

Fig. 144: Intake Manifold And Gasket
 Courtesy of GENERAL MOTORS COMPANY

17. Remove Intake Manifold (1)
18. Remove and DISCARD the gasket. (2)

Disassemble Procedure

1. Remove Upper Intake Manifold Cover. Refer to [Upper Intake Manifold Cover Replacement](#)
2. Remove Lower Intake Manifold Cover. Refer to [Lower Intake Manifold Cover Replacement](#)

Assemble Procedure

1. Install Upper Intake Manifold Cover. Refer to [Upper Intake Manifold Cover Replacement](#)
2. Install Lower Intake Manifold Cover. Refer to [Lower Intake Manifold Cover Replacement](#)

Fig. 145: Intake Manifold And Gasket

Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW gasket. (2)
2. Install Intake Manifold (1)

Fig. 146: Intake Manifold And Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Keep the fasteners in position on the assembly.

3. Install Bolts (2) (Qty: 5) @ Intake Manifold

Fig. 147: Intake Manifold Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to: Fastener Caution

4. Tighten the 5 intake Manifold Bolts to 12 N.m (106 lb in) in the sequence as shown.

Fig. 148: A/C High Pressure Cutoff Switch, Electrical Connector, Retainer And Engine Wiring Harness
 Courtesy of GENERAL MOTORS COMPANY

5. Reposition Engine Wiring Harness (4)
6. Install Retainer (3)
7. Connect the electrical connector (2) to the air conditioning high pressure cutoff switch (1).

Fig. 149: Air Cleaner Resonator Bracket, Retainers And Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Install the air cleaner resonator bracket (2).
9. Install and tighten Bolt (3) to 9 N.m (80 lb in)
10. Install Retainers (1) (Qty: 2)

Fig. 150: Fuel Feed Front Pipe And Fuel Injection Pump
Courtesy of GENERAL MOTORS COMPANY

11. Remove all EN-6015 plugs from the connections.
12. Connect Fuel Feed Front Pipe (2) @ Fuel Injection Pump (1)
13. Install Exhaust Gas Recirculation Pipe. Refer to [Exhaust Gas Recirculation Pipe Replacement](#)
14. Install Manifold Absolute Pressure Sensor. Refer to [Manifold Absolute Pressure Sensor Replacement](#)
15. Install Throttle Body Assembly. Refer to [Throttle Body Assembly Replacement](#)
16. Install Evaporative Emission Canister Purge Solenoid Valve. Refer to [Evaporative Emission Canister Purge Solenoid Valve Replacement](#)
17. Install Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
18. Install Dash Upper Extension Panel Opening Cover. Refer to [Dash Upper Extension Panel Opening Cover Replacement](#)

19. Enable the high voltage system. Refer to [High Voltage Enabling](#)

CATALYTIC CONVERTER BRACE BRACKET REPLACEMENT

Removal Procedure

1. Remove Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)

Fig. 151: Catalytic Converter Brace Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Remove Catalytic Converter Brace Bracket Bolts (2) (Qty: 2)
3. Remove Catalytic Converter Brace Bracket (1)

Installation Procedure

Fig. 152: Catalytic Converter Brace Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Catalytic Converter Brace Bracket (1)

CAUTION: Refer to [Fastener Caution](#)

2. Install and tighten Catalytic Converter Brace Bracket Bolts (2) (Qty: 2) to 22 N.m (16 lb ft)
3. Install Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)

CATALYTIC CONVERTER BRACKET REPLACEMENT - LOWER

Removal Procedure

1. Remove Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)

Fig. 153: Catalytic Converter, Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

2. Remove the 2 catalytic converter bracket nuts (3).
3. Remove the catalytic converter bracket (2) from the catalytic converter (1).

Installation Procedure

Fig. 154: Catalytic Converter, Bracket And Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Install the catalytic converter bracket (2) to the catalytic converter (1).

CAUTION: Refer to [Fastener Caution](#)

2. Install the catalytic converter bracket nuts (3) (Qty: 2) and tighten to 22 N.m (16 lb ft)
3. Install Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)

CRANKSHAFT BALANCER REPLACEMENT

Special Tools

- EN-44226 Crankshaft Balancer Remover
- EN-44226-5 Crankshaft Protector
- EN-45059 Angle Meter
- EN-51368 Front Crankshaft Seal Installer

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Water Pump Belt. Refer to [Water Pump Belt Replacement](#)

Fig. 155: Crankshaft Balancer, Special Tools And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Install the **EN-44226-1** remover (2) to the crankshaft balancer (1).
3. Loosen the crankshaft balancer bolt (3) by counter holding the crankshaft balancer (1) with the **EN-44226-1** remover (3) and suitable tool.
4. Remove the **EN-44226-1** remover.
5. Remove Crankshaft Balancer Bolt

Fig. 156: Protector And Crankshaft
Courtesy of GENERAL MOTORS COMPANY

6. Install the **EN-44226-5** protector (1) to the crankshaft (2).

Fig. 157: Remover Plate Assembly And Balancer
Courtesy of GENERAL MOTORS COMPANY

7. Install **EN-44226-1** remover (2) and **EN-44226-2** remover plate (3) onto the balancer (4).
8. Install the **EN-44226-3** remover screw (1) through the **EN-44226-2** remover plate and against the **EN-44226-5** protector.
9. Counter hold the **EN-44226-2** remover plate and turn the **EN-51368** installer screw to remove the balancer.
10. Remove the **EN-44226** remover.
11. Remove the crankshaft balancer (4).

12. Remove the **EN-44226-5** protector.

Installation Procedure

Fig. 158: Crankshaft Balancer And Installer Tool
Courtesy of GENERAL MOTORS COMPANY

1. Install Crankshaft Balancer (1) @ Crankshaft (2)
2. Install the **EN-51368** installer (3).
3. Install the crankshaft balancer by screwing the flange from **EN-51368** installer.
4. Remove the **EN-51368** installer.

Fig. 159: Crankshaft Balancer, Special Tools And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Install and hand tighten the crankshaft balancer bolt (3).
6. Install the EN-44226-1 remover (2) to the crankshaft balancer (1).

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

7. Tighten the crankshaft balancer bolt (3) by counter holding the crankshaft balancer (1) with the EN-44226-1 (3) and torque wrench.
 1. First pass to 100 N.m (74 lb ft).
 2. Loosen the bolt to 360 degrees.
 3. Final pass to an additional 180 degrees, using the EN-45059 meter.
8. Remove EN-44226-1 remover (2) from the crankshaft balancer (1).
9. Install Water Pump Belt. Refer to [Water Pump Belt Replacement](#)

CRANKSHAFT POSITION SENSOR RELUCTOR RING REPLACEMENT

Removal Procedure

1. Remove Automatic Transmission Flex Plate. Refer to [Automatic Transmission Flex Plate Replacement](#)

Fig. 160: Crankshaft Position Sensor Reluctor Ring
Courtesy of GENERAL MOTORS COMPANY

2. Remove the crankshaft position sensor reluctor ring. (2)

Installation Procedure

Fig. 161: Crankshaft Position Sensor Reluctor Ring
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Crankshaft Position Sensor Reluctor Ring Caution](#) .

1. Install the crankshaft position sensor reluctor ring. (2)
2. Install the pin (3) into the correct hole (1).
3. Install Automatic Transmission Flex Plate. Refer to [Automatic Transmission Flex Plate Replacement](#)

CRANKSHAFT FRONT OIL SEAL REPLACEMENT

Special Tools

- **EN-51368** Front Crankshaft Seal Installer
- **DT-6125-B** Slide Hammer
- **DT-23129** Seal Remover

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)

Fig. 162: Identifying Crankshaft Front Oil Seal Designs
Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine can be equipped with two different front oil seal designs.

2. Check which one of crankshaft front oil seals (1, 2) is installed.

Fig. 163: Crankshaft Front Oil Seal And Removal Tool
Courtesy of GENERAL MOTORS COMPANY

3. Install the **DT-6125-B** hammer (3) to **DT-23129** seal remover (1).
4. Install the **DT-6125-B** hammer with the **DT-23129** seal remover behind the crankshaft front oil seal (2).

5. Remove the crankshaft front oil seal (2), use the **DT-6125-B** hammer.

Installation Procedure

Fig. 164: Identifying Crankshaft Front Oil Seal Designs
Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine can be equipped with two different front oil seal designs.

1. Check which one of crankshaft front oil seals (1, 2) is installed.

Fig. 165: Crankshaft Front Oil Seal And Installer Tool (First Design)
Courtesy of GENERAL MOTORS COMPANY

2. For front oil seal first design, use the following procedure:

NOTE: The special tool EN-51368 seal installer can be used in two positions, depending which crankshaft front oil seal type is used.

3. Install the crankshaft front oil seal (1) to the **EN-51368** seal installer (2) with the notch on the surface (3).

Fig. 166: Crankshaft Front Oil Seal And Installer Tool (Second Design)
 Courtesy of GENERAL MOTORS COMPANY

4. For front oil seal second design, use the following procedure:

NOTE: The special tool EN-51368 seal installer can be used in two positions, depending which crankshaft front oil seal type is used.

5. Install the crankshaft front oil seal (1) to the **EN-51368** seal installer (2) with the plane surface (3).

Fig. 167: Installing Crankshaft Front Oil Seal
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Be careful that the crankshaft front oil seal does not deform while installing. Failing to do so may reduce the leak-tightness and could cause damage to the crankshaft.

6. Press the crankshaft front oil seal into the correct seat, by tightening the nut (2) from the **EN-51368** seal installer (1).
7. Remove the **EN-51368** seal installer.
8. Check the correct seat of the crankshaft front oil seal.

9. Install Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)

CRANKSHAFT REAR OIL SEAL REPLACEMENT

Special Tools

EN-51369 Rear Crankshaft Seal Installer

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Crankshaft Position Sensor Reluctor Ring. Refer to [Crankshaft Position Sensor Reluctor Ring Replacement](#)

Fig. 168: Identifying Crankshaft Rear Oil Seals
Courtesy of GENERAL MOTORS COMPANY

NOTE: The engine could be equipped with two different rear oil seal designs.

2. Check which of the crankshaft rear oil seals (1, 2) are installed.

Fig. 169: Removing Crankshaft Rear Oil Seal

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Be careful that the crankshaft will not be damaged while the crankshaft rear oil seal is pulled out. Failing to do so may reduce the leak-tightness and could cause damage to the crankshaft.

3. Use a suitable tool to remove the seal.
4. Remove Crankshaft Rear Oil Seal (1)

Installation Procedure

Fig. 170: RTV Sealant Application Points

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the seal recess (1) for excess sealer material at the lower crankcase to engine block mating location.
2. Remove excess sealer, if present.
3. Add RTV sealer at the 2 locations (1) where the bed plate and block join prior to installing the oil seal. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Fig. 171: Oil Seal And Installer

Courtesy of GENERAL MOTORS COMPANY

NOTE: The oil seal must be installed in the correct direction. The side that faces out will have "this side out" printed on it. Depending on seal design, the way the seal is installed on the EN-51369 installer is opposite. Either the seal is installed over the back of the installer, or the seal is installed over the front of the installer. Match the seal design as shown above and install the seal onto the installer in the correct direction.

4. Install the oil seal (1, 2) in the correct direction on the **EN-51369** installer.

NOTE: If the seal is improperly installed on the special tool, it will not install correctly.

5. Inspect the seal on **EN-51369** installer, and ensure that the seal lip is not deformed. If necessary, remove the seal and reinstall on the special tool.

NOTE: The special tool installs and establishes the proper depth of the seal in the crankshaft seal bore.

6. Use **EN-51369** installer to press the new crankshaft seal into the housing.

Fig. 172: Crankshaft Rear Oil Seal Installed Properly
Courtesy of GENERAL MOTORS COMPANY

7. Ensure that the crankshaft rear oil seal (1) is installed in the crankshaft seal bore flush to 0.5 mm (0.2 in) depth (2).

CRANKSHAFT SPROCKET REPLACEMENT

Removal Procedure

1. Remove Oil Pump Drive Chain. Refer to [Oil Pump Drive Chain Replacement](#)

Fig. 173: Crankshaft Sprocket And Balancer Key
Courtesy of GENERAL MOTORS COMPANY

2. Remove Crankshaft Sprocket (1)
3. Remove the crankshaft balancer key. (2)

Installation Procedure

Fig. 174: Crankshaft Sprocket And Balancer Key
Courtesy of GENERAL MOTORS COMPANY

1. Install the crankshaft balancer key (2).
2. Align the keyway of the crankshaft sprocket with the crankshaft balancer key.
3. Install Crankshaft Sprocket (1).
4. Install Oil Pump Drive Chain. Refer to [Oil Pump Drive Chain Replacement](#)

CRANKSHAFT OIL DEFLECTOR REPLACEMENT

Removal Procedure

1. Remove Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)

Fig. 175: Positive Crankcase Ventilation Oil Separator Drain Pipe, Bolt And Seal
Courtesy of GENERAL MOTORS COMPANY

2. Remove and DISCARD the positive crankcase ventilation oil separator drain pipe bolt (4).
3. Remove the positive crankcase ventilation oil separator drain pipe (2).
4. Remove and the positive crankcase ventilation oil separator seal (1). Check for damage.

Fig. 176: Crankshaft Oil Deflector And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove and DISCARD the 3 crankshaft oil deflector bolts (3).
6. Remove the crankshaft oil deflector. (1)

Installation Procedure

Fig. 177: Crankshaft Oil Deflector And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install the crankshaft oil deflector (1).

CAUTION: Refer to [Fastener Caution](#) .

2. Install the 3 NEW crankshaft oil deflector bolts (3) and tighten to 10 N.m (89 lb in).

Fig. 178: Positive Crankcase Ventilation Oil Separator Drain Pipe, Bolt And Seal
Courtesy of GENERAL MOTORS COMPANY

3. Install the positive crankcase ventilation oil separator seal (1).
4. Install the positive crankcase ventilation oil separator drain pipe (2).
5. Install the NEW positive crankcase ventilation oil separator drain pipe bolt (4) and tighten to 10 N.m (89 lb in).
6. Install Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)

ENGINE LIFT FRONT BRACKET REPLACEMENT

Removal Procedure

1. Remove Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)

Fig. 179: Engine Wiring Harness And Retainer
Courtesy of GENERAL MOTORS COMPANY

2. Remove the retainer that secures the cable to the bracket. (1)
3. Position aside Engine Wiring Harness (2).

Fig. 180: Engine Lift Bracket Bolt And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove Engine Lift Bracket Bolts (2) (Qty: 2)
5. Remove Engine Lift Bracket (1)

Installation Procedure

Fig. 181: Engine Lift Bracket Bolt And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Lift Bracket (1)

CAUTION: Refer to [Fastener Caution](#)

2. Install and tighten Engine Lift Bracket Bolts (2) (Qty: 2) to 25 N.m (18 lb ft)

Fig. 182: Engine Wiring Harness And Retainer
Courtesy of GENERAL MOTORS COMPANY

3. Reposition Engine Wiring Harness (2)
4. Install the retainer. (1)
5. Install Air Cleaner Outlet Duct. Refer to [Air Cleaner Outlet Duct Replacement](#)

ENGINE LIFT REAR BRACKET REPLACEMENT

Fig. 183: Engine Lift Rear Bracket

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Three-Way Catalytic Converter. Refer to Three-Way Catalytic Converter Replacement	
1	Engine Lift Bracket Bolt (Qty: 2) CAUTION: Refer to Fastener Caution Tighten 25 N.m (18 lb ft)
2	Engine Lift Rear Bracket

CYLINDER HEAD REPLACEMENT

Special Tools

- EN-6015 Closure Plugs
- EN-36857 Engine Lift Bracket
- EN-45059 Angle Meter
- EN-51367 Camshaft Holder

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)
3. Remove Exhaust Gas Recirculation Valve. Refer to [Exhaust Gas Recirculation Valve Replacement](#)
4. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
5. Remove Intake Manifold. Refer to [Intake Manifold Replacement](#)
6. Remove Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)
7. Remove Water Outlet. Refer to [Water Outlet Replacement](#)
8. Drain the engine oil. Refer to [Draining Fluids and Oil Filter Removal](#)

Fig. 184: Electrical Connector And Fuel Injection Pump

Courtesy of GENERAL MOTORS COMPANY

9. Disconnect Electrical Connector (1) @ Fuel Injection Pump
10. Remove Water Pump Belt. Refer to [Water Pump Belt Replacement](#)

Fig. 185: Crankshaft Balancer Markings

Courtesy of GENERAL MOTORS COMPANY

11. Adjust the engine to cylinder 1 top dead center (TDC) of combustion stroke. Set crankshaft in direction of engine rotation until the markings (1, 2) line up. Rotate at the crankshaft balancer bolt (3).
12. Remove Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)
13. Lower the vehicle.
14. Remove Engine Mount Bracket. Refer to [Engine Mount Bracket Replacement](#)

Fig. 186: Oil Pan Bolts And Upper Oil Pan

Courtesy of GENERAL MOTORS COMPANY

15. Remove the 3 oil pan bolts (1) from the upper oil pan.

Fig. 187: Engine Front Cover Bolts
 Courtesy of GENERAL MOTORS COMPANY

- 16. Remove Engine Front Cover Bolts (2, 4) (Qty: 12)
- 17. Remove Engine Front Cover Bolt (1)
- 18. Remove Engine Front Cover Bolt (3)

Fig. 188: Engine Front Cover Pry Points
 Courtesy of GENERAL MOTORS COMPANY

- 19. Loosen the engine front carefully from the engine, use a suitable tool at the location as shown to pry (1, 2, 3).

Fig. 189: Engine Front Cover And Crankshaft Front Oil Seal
Courtesy of GENERAL MOTORS COMPANY

- 20. Remove Engine Front Cover (1)
- 21. Remove Crankshaft Front Oil Seal (2)

Fig. 190: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

- 22. Install the EN-51367 holder (1).
- 23. Remove Timing Chain Upper Guide. Refer to [Timing Chain Upper Guide Replacement](#)

Fig. 191: Timing Chain Tensioner In Service Position
Courtesy of GENERAL MOTORS COMPANY

24. Fix the timing chain tensioner with design (1) in service position:

Fig. 192: Releasing Tension From Piston
Courtesy of GENERAL MOTORS COMPANY

1. Slightly release tension from the piston (2) until bar (1) can be unlocked by rotating the lever (3) in direction of arrow.

Fig. 193: Piston And Tensioner Lever

Courtesy of GENERAL MOTORS COMPANY

2. Entirely push back the piston (1) until the tensioner lever (2) cannot be locked in this position.

Fig. 194: Piston

Courtesy of GENERAL MOTORS COMPANY

3. Release tension from the piston (1) until it releases for three ratchets. The three ratchets can be noticed by the click noises.

Fig. 195: Lever And Fixing Pin

Courtesy of GENERAL MOTORS COMPANY

4. Apply tension to the piston until the lever (1) is rotated back into the locking position where the bore in the lever aligns with the bore in the tensioner housing.
5. Fix the lever in this position with a suitable fixing pin (2).

Fig. 196: Timing Chain Tensioner Shoe And Bolt

Courtesy of GENERAL MOTORS COMPANY

25. Remove Timing Chain Tensioner Shoe Bolt (1)
26. Remove Timing Chain Tensioner Shoe (2)

Fig. 197: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

27. Ensure the correct fixation of the tool (3).
28. Remove Timing Chain Tensioner Bolt (4) (Qty: 2)
29. Remove Timing Chain Tensioner (1)
30. Remove and DISCARD the gasket. (2)

Fig. 198: Timing Chain
Courtesy of GENERAL MOTORS COMPANY

31. Remove Timing Chain (1)

Fig. 199: Right Side Timing Chain Guide And Bolts
Courtesy of GENERAL MOTORS COMPANY

- 32. Remove Timing Chain Guide Bolts (2) (Qty: 3)
- 33. Remove Timing Chain Guide (1)

Fig. 200: Engine Lift Bracket, Fixture Hook And Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a device to support the engine while repositioning the lift hook.

- 34. Install the **EN-36857** engine lift bracket (2) then install the fastener (1).
- 35. Reposition the engine support fixture hook (3) to the newly installed **EN-36857** engine lift bracket (2).

Fig. 201: Cylinder Head Bolt Loosening/Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

36. Loosen the 10 cylinder head bolts in sequence as shown.

Fig. 202: Cylinder Head, Bolts And Gasket
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: In order to prevent damage to the valves and injectors during cylinder head removal, set the cylinder head on blocks.

37. Remove and DISCARD Cylinder Head Bolts (2) (Qty: 10)
38. Remove Cylinder Head (1)
39. Remove and DISCARD Cylinder Head Gasket (3).
40. In case of re-use, then clean and inspect the cylinder head. Refer to [Cylinder Head Cleaning and Inspection](#).

Disassemble Procedure

1. Remove Fuel Injection Pump. Refer to [Fuel Injection Pump Replacement](#)
2. Remove Engine Lift Front Bracket. Refer to [Engine Lift Front Bracket Replacement](#)
3. Remove Engine Lift Rear Bracket. Refer to [Engine Lift Rear Bracket Replacement](#)
4. Remove Exhaust Camshaft. Refer to [Exhaust Camshaft Replacement](#)
5. Remove Intake Camshaft. Refer to [Intake Camshaft Replacement](#)
6. Remove Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)
7. Remove Hydraulic Valve Lash Adjuster. Refer to [Hydraulic Valve Lash Adjuster Replacement](#)
8. Disassembly cylinder head. Refer to [Cylinder Head Disassemble](#)

Assemble Procedure

1. Assemble cylinder head. Refer to [Cylinder Head Assemble](#)
2. Install Hydraulic Valve Lash Adjuster. Refer to [Hydraulic Valve Lash Adjuster Replacement](#)
3. Install Hydraulic Valve Lash Adjuster Arm. Refer to [Hydraulic Valve Lash Adjuster Arm Replacement](#)
4. Install Intake Camshaft. Refer to [Intake Camshaft Replacement](#)
5. Install Exhaust Camshaft. Refer to [Exhaust Camshaft Replacement](#)
6. Install Engine Lift Rear Bracket. Refer to [Engine Lift Rear Bracket Replacement](#)
7. Install Engine Lift Front Bracket. Refer to [Engine Lift Front Bracket Replacement](#)
8. Install Fuel Injection Pump. Refer to [Fuel Injection Pump Replacement](#)

Installation Procedure

1. Clean all sealing surfaces.
2. Inspect the flatness of cylinder head and the engine block sealing surfaces.

Fig. 203: Cylinder Head, Bolts And Gasket
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure that the cylinder head and the cylinder block sealing surfaces are clear of oil, grease and old gasket material.

3. Install a NEW cylinder head gasket (3).
4. Install Cylinder Head (1)
5. Install, but do NOT tighten NEW Cylinder Head Bolts (2) (Qty: 10) - Use NEW bolts.

Fig. 204: Cylinder Head Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to Fastener Caution

CAUTION: Refer to Torque-to-Yield Fastener Caution

6. Tighten Cylinder Head Bolts (2) (Qty: 10) in sequence
 1. First Pass: 25 N.m (18 lb ft).
 2. Second Pass: 30 N.m (22 lb ft)
 3. Final Pass: 240 degrees, use the **EN-45059** meter.

Fig. 205: Engine Lift Bracket, Fixture Hook And Bolt
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Use a device to support the engine while repositioning the lift hook.

7. Remove Bolt (1)
8. Reposition the lift hook (3) from the **EN-36857** engine lift bracket (2) to the cylinder head lift bracket.
9. Remove **EN-36857** engine lift bracket

10. Remove the suitable device holding the engine during lift hook repositioning.

Fig. 206: Right Side Timing Chain Guide And Bolts
Courtesy of GENERAL MOTORS COMPANY

11. Install Timing Chain Guide (1)

12. Install and tighten Timing Chain Guide Bolts (2) (Qty: 3) to 10 N.m (89 lb in)

Fig. 207: Timing Chain
Courtesy of GENERAL MOTORS COMPANY

NOTE: Ensure the actuator timing marks are approximately the 12 o'clock position.

13. Install Timing Chain (1)

Fig. 208: Timing Chain Marks

Courtesy of GENERAL MOTORS COMPANY

14. Ensure that the colored link (3) matches to the arrow on the crankshaft sprocket.
15. Ensure that the colored links (1, 2) match to the marks on the camshaft position adjuster actuators.

Fig. 209: Timing Chain Tensioner Tool, Timing Chain Tensioner, Bolts And Gasket

Courtesy of GENERAL MOTORS COMPANY

16. Install a NEW gasket. (2)
17. Install Timing Chain Tensioner (1)
18. Install and tighten Timing Chain Tensioner Bolts (4) (Qty: 2) 25 N.m (18 lb ft)

Fig. 210: Timing Chain Tensioner Shoe And Bolt
Courtesy of GENERAL MOTORS COMPANY

19. Install Timing Chain Tensioner Shoe (2)
20. Install and tighten Timing Chain Tensioner Shoe Bolt (1) to 25 N.m (18 lb ft)
21. Remove the suitable tool (3) from the timing chain tensioner.

Fig. 211: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

22. Remove the EN-51367 holder (1).
23. Install Timing Chain Upper Guide. Refer to [Timing Chain Upper Guide Replacement](#)
24. Check the position of the crankshaft, camshaft and camshaft position actuator adjuster:
 1. Install the engine front cover with 4 bolts and the crankshaft balancer.

Fig. 212: Crankshaft Balancer Markings
Courtesy of GENERAL MOTORS COMPANY

2. Turn crankshaft 720 degrees in the direction of engine rotation by the crankshaft balancer bolt (3).

Fig. 213: Camshaft Holder
Courtesy of GENERAL MOTORS COMPANY

25. Install the **EN-51367** holder (1).
26. If the **EN-51367** holder (1) can be installed, the engine timing is properly adjusted.
27. Remove the **EN-51367** holder.
28. Remove the engine front cover and crankshaft balancer.

Fig. 214: Coiled Spring Pins And Engine Front Cover
Courtesy of GENERAL MOTORS COMPANY

29. Gently tap coiled spring pins (1) back into front cover so they are flush with front cover sealing surface.

Fig. 215: Engine Front Cover Sealant Application Areas

Courtesy of GENERAL MOTORS COMPANY

NOTE: The lower crankcase and oil pan mating surfaces must be free of contamination prior to applying the sealer.

Install and align the oil pan to block within 20 minutes of applying the sealer.

The oil pan must be fastened to final torque specification within 60 minutes of applying the sealer.

Additional sealant is necessary to reduce the possibility of leakage where the cylinder head to engine block interface along the bead path flange on the front cover.

30. Apply approximately a 4 mm (0.16 in) thick bead of engine front cover sealant (2) to the engine lower front cover. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended sealant.
31. Apply a 3 mm (0.12 in) bead of sealer circling 3 locations (1) on the interior of the engine front cover.

Fig. 216: Oil Pan Sealant Application Areas

Courtesy of GENERAL MOTORS COMPANY

32. Apply a 3 mm (0.12 in) bead of sealer circling 3 locations (1) on the oil pan. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended sealant.

Fig. 217: Engine Front Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

33. Install Engine Front Cover (1)
34. Install Engine Front Cover Bolts (2) (Qty: 2)
35. Hand tighten the bolts.

Fig. 218: Coiled Spring Pins And Engine Front Cover
Courtesy of GENERAL MOTORS COMPANY

36. Gently tap coiled spring pins (1) back into cover until pins are flush with front cover (2).

Fig. 219: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

- 37. Install Engine Front Cover Bolt (2, 4) (Qty: 10)
- 38. Install Engine Front Cover Bolt (1)
- 39. Install Engine Front Cover Bolt (3)

Fig. 220: Engine Front Cover Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

- 40. Tighten the bolts in the sequence shown.
- 41. Tighten Engine Front Cover Bolt (2) to 58 N.m (43 lb ft)
- 42. Tighten all other engine front cover bolts to 15 N.m (11 lb ft).

Fig. 221: Oil Pan Bolts And Upper Oil Pan
Courtesy of GENERAL MOTORS COMPANY

43. Install and tighten Oil Pan Bolts (1) (Qty: 3) to 10 N.m (89 lb in).
44. Install Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)
45. Install Water Pump Belt. Refer to [Water Pump Belt Replacement](#)
46. Lower the vehicle.
47. Install Engine Mount Bracket. Refer to [Engine Mount Bracket Replacement](#)

Fig. 222: Electrical Connector And Fuel Injection Pump
Courtesy of GENERAL MOTORS COMPANY

48. Connect Electrical Connector (1) @ Fuel Injection Pump
49. Install Water Outlet. Refer to [Water Outlet Replacement](#)
50. Install Three-Way Catalytic Converter. Refer to [Three-Way Catalytic Converter Replacement](#)
51. Install Intake Manifold. Refer to [Intake Manifold Replacement](#)
52. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
53. Install Exhaust Gas Recirculation Valve. Refer to [Exhaust Gas Recirculation Valve Replacement](#)

54. Install Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)
55. Fill the engine oil to the proper level with NEW engine oil. Refer to [Approximate Fluid Capacities](#)
56. Enable the high voltage system. Refer to [High Voltage Enabling](#)

ENGINE FRONT COVER REPLACEMENT

Removal Procedure

1. Remove Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
2. Remove Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
3. Remove Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
4. Remove Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)

NOTE: Remove the air conditioning and drive motor battery cooling compressor replacement without disconnect any hoses and lines.

5. Reposition away Air Conditioning and Drive Motor Battery Cooling Compressor. Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#)
6. Drain the engine oil. Refer to [Draining Fluids and Oil Filter Removal](#)
7. Remove Engine Mount Bracket. Refer to [Engine Mount Bracket Replacement](#)

Fig. 223: Oil Pan Bolts And Upper Oil Pan
Courtesy of GENERAL MOTORS COMPANY

8. Remove Oil Pan Bolts (1) (Qty: 3) @ Upper Oil Pan

Fig. 224: Engine Front Cover Bolts
 Courtesy of GENERAL MOTORS COMPANY

9. Remove Engine Front Cover Bolts (2, 4) (Qty: 12)
10. Remove Engine Front Cover Bolt (1)
11. Remove Engine Front Cover Bolt (3)

Fig. 225: Engine Front Cover Pry Points
 Courtesy of GENERAL MOTORS COMPANY

12. Loosen the engine front cover carefully from the engine, use a suitable tool at the location as shown to pry (1, 2, 3).

Fig. 226: Engine Front Cover And Crankshaft Front Oil Seal
Courtesy of GENERAL MOTORS COMPANY

13. Remove Engine Front Cover (1)
14. Remove Crankshaft Front Oil Seal (2)
15. Clean all sealing surfaces.

Installation Procedure

Fig. 227: Coiled Spring Pins And Engine Front Cover
Courtesy of GENERAL MOTORS COMPANY

1. Gently tap coiled spring pins (1) back into front cover so they are flush with front cover sealing surface.

Fig. 228: Engine Front Cover Sealant Application Areas

Courtesy of GENERAL MOTORS COMPANY

NOTE: The lower crankcase and oil pan mating surfaces must be free of contamination prior to applying the sealer.

Install and align the oil pan to block within 20 minutes of applying the sealer.

The oil pan must be fastened to final torque specification within 20 minutes of applying the sealer.

Additional sealant is necessary to reduce the possibility of leakage where the cylinder head to engine block interface along the bead path flange on the front cover.

2. Apply approximately a 4 mm (0.16 in) thick bead of engine front cover sealant (2) to the engine lower front cover. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended sealant.
3. Apply a 3 mm (0.12 in) bead of sealer circling 3 locations (1) on the interior of the engine front cover.

Fig. 229: Oil Pan Sealant Application Areas
Courtesy of GENERAL MOTORS COMPANY

4. Apply a 3 mm (0.12 in) bead of sealer circling 3 locations (1) on the oil pan. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#) for the recommended sealant.

Fig. 230: Engine Front Cover And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install Engine Front Cover (1)
6. Install Engine Front Cover Bolts (2) (Qty: 2)
7. Hand tighten the bolts.

Fig. 231: Coiled Spring Pins And Engine Front Cover
Courtesy of GENERAL MOTORS COMPANY

8. Gently tap coiled spring pins (1) back into cover until pins are flush with front cover (2).

Fig. 232: Engine Front Cover Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Install Engine Front Cover Bolts (2, 4) (Qty: 10)
10. Install Engine Front Cover Bolt (1)
11. Install Engine Front Cover Bolt (3)

Fig. 233: Engine Front Cover Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

12. Tighten the bolts in the sequence shown.
13. Tighten Engine Front Cover Bolt (2) to 58 N.m (43 lb ft)
14. Tighten all other engine front cover bolts to 15 N.m (11 lb ft).

Fig. 234: Oil Pan Bolts And Upper Oil Pan
 Courtesy of GENERAL MOTORS COMPANY

15. Install and tighten Oil Pan Bolts (1) (Qty: 3) to 10 N.m (89 lb in)
16. Install Crankshaft Front Oil Seal. Refer to [Crankshaft Front Oil Seal Replacement](#)
17. Lower the vehicle.
18. Install Engine Mount Bracket. Refer to [Engine Mount Bracket Replacement](#)
19. Install Air Conditioning and Drive Motor Battery Cooling Compressor. Refer to [Air Conditioning and Drive Motor Battery Cooling Compressor Replacement](#)
20. Install Crankshaft Balancer. Refer to [Crankshaft Balancer Replacement](#)

21. Install Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
22. Install Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
23. Install Camshaft Cover. Refer to [Camshaft Cover Replacement](#)
24. Check and correct the engine oil level. Refer to [Approximate Fluid Capacities](#)

ENGINE MOUNT BRACKET REPLACEMENT

Special Tools

EN-45059 Angle Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
3. Lower the vehicle.
4. Install Engine Support Fixture. Refer to [Engine Support Fixture](#)
5. Remove Engine Mount. Refer to [Engine Mount Replacement](#)
6. Adjust the engine support fixture to position the engine as necessary to gain access the engine mount bracket bolts.

Fig. 235: Engine Mount Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

7. Remove and DISCARD Engine Mount Bracket Bolt (1) @ Engine Mount Bracket (2)

Fig. 236: Engine Mount Bracket And Bolts

Courtesy of GENERAL MOTORS COMPANY

8. Remove and DISCARD Engine Mount Bracket Bolts (2) (Qty: 2)
9. Remove Engine Mount Bracket (1)

Installation Procedure

Fig. 237: Engine Mount Bracket And Bolts

Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Mount Bracket (1)
2. Install NEW Engine Mount Bracket Bolts (2) (Qty: 2). Use NEW bolts.

Fig. 238: Engine Mount Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Install NEW Engine Mount Bracket Bolt (1). Install a NEW bolt.

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

4. Tighten Engine Mount Bracket Bolts (Qty: 3)
 1. First Pass: 58 N.m (43 lb ft).
 2. Final Pass: 90 - 105 degrees, use the **EN-45059** meter.
5. Install Engine Mount. Refer to [Engine Mount Replacement](#)
6. Remove Engine Support Fixture. Refer to [Engine Support Fixture](#)
7. Raise the vehicle.
8. Install Front Wheelhouse Liner (Right Side). Refer to [Front Wheelhouse Liner Replacement \(Right Side\)](#)
9. Lower the vehicle.

ENGINE MOUNT REPLACEMENT

Special Tools

J-36857 Engine Lift Bracket

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)

Fig. 239: Engine Lift Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Install the J-36857 Bracket (2) into the engine block bore.

CAUTION: Refer to [Fastener Caution](#)

3. Install and tighten Engine Lift Bracket Bolt (1) to 25 N.m (18 lb ft)
4. Using a hydraulic engine lifter, support the engine at the J-36857 Bracket Apply tension to the hydraulic lifter.

Fig. 240: Engine Mount, Engine Mount Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove and DISCARD the 2 engine mount to engine mount bracket bolts (2).
6. Remove and DISCARD the 3 engine mount to body bolts (1, 3).
7. Remove Engine Mount (4)

Installation Procedure

Fig. 241: Engine Mount, Engine Mount Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Engine Mount (4)
2. Install 3 NEW engine mount to body bolts (1, 3) and tighten in two passes:

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

1. First Pass: 100 N.m (74 lb ft)
2. Final Pass: 60 - 75 degrees - **EN-45059** meter
3. Install 2 NEW engine mount to engine mount bracket bolts (2) and tighten in two passes:

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

1. First Pass: 100 N.m (74 lb ft)
2. Final Pass: 60 - 75 degrees - **EN-45059** meter
4. Remove the hydraulic engine lifter from the **J-36857** Bracket.

Fig. 242: Engine Lift Bracket And Bolt

Courtesy of GENERAL MOTORS COMPANY

5. Remove Engine Lift Bracket Bolt (1)
6. Remove the J-36857 Bracket (2).
7. Install Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)

UPPER OIL PAN REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove Front Compartment Air Deflector. Refer to [Front Compartment Air Deflector Replacement](#)
3. Remove Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)

Fig. 243: Lower Oil Pan And Locating Pins

Courtesy of GENERAL MOTORS COMPANY

4. Remove Lower Oil Pan (2). Refer to [Lower Oil Pan Replacement](#)
5. Remove Transmission Mount Strut Bracket. Refer to [Transmission Mount Strut Bracket Replacement](#)
6. Remove Exhaust Muffler. Refer to [Exhaust Muffler Replacement](#)
7. Drain the engine oil. Refer to [Engine Oil and Oil Filter Replacement](#)

Fig. 244: Drivetrain And Front Suspension Cradle, Brace And Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Remove the drivetrain and front suspension brace bolts (3).
9. Remove the drivetrain and front suspension brace (2) from the drivetrain and front suspension cradle (1).

Fig. 245: Engine Oil Level Indicator Control Module Wiring Harness And Electrical Connector

11. Disconnect Electrical Connector (2) @ Oil Pump Flow Control Solenoid Valve (1)

Fig. 247: Engine Oil Level Indicator Control Module, Wiring Harness And Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Remove the oil level indicator control module bolt. (1)
13. Remove Engine Oil Level Indicator Control Module Wiring Harness (2)

Fig. 248: Transmission Converter Cover And Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

14. Remove Transmission Bolts (1, 2) (Qty: 3)
15. Remove the transmission converter cover (3).

Fig. 249: Heater Inlet And Outlet Hose Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

16. Remove Heater Inlet and Outlet Hose Bracket Bolt (1)
17. Position aside Heater Inlet and Outlet Hose Bracket (2)
18. Lower the vehicle.
19. Remove Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)
20. Install Engine Support Fixture. Refer to [Engine Support Fixture](#)

Fig. 250: Engine Mount, Engine Mount Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

21. Remove and DISCARD the 2 engine mount to engine mount bracket bolts (2).
22. Remove and DISCARD the 3 engine mount to body bolts (1, 3).
23. Remove Engine Mount (4)
24. Raise the engine with the engine support fixture to gain enough space for the removal of the upper oil pan.
25. Raise the vehicle.

Fig. 251: Oil Pan Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: Take note that there are different bolt lengths.

26. Remove the oil pan bolts. (4) (Qty: 2)
27. Remove the oil pan bolts. (3) (Qty: 2)
28. Remove the oil pan bolts. (1, 2) (Qty: 12)

Fig. 252: Upper Oil Pan

Courtesy of GENERAL MOTORS COMPANY

29. Loosen the upper oil pan (2) carefully from the engine block, use a suitable tool at the location as shown to pry (1, 3).
30. Remove Upper Oil Pan (2)

Installation Procedure

NOTE: The lower crankcase and oil pan mating surfaces must be free of contamination prior to applying the sealer.

Install and align the oil pan to block within 20 minutes of applying the sealer.

The oil pan must be fastened to final torque specification within 60 minutes of applying the sealer.

Additional sealant is necessary to reduce the possibility of leakage where the cylinder head to engine block interface along the bead path flange on the front cover.

1. Clean the oil pan sealing surface.

Fig. 253: Upper Oil Pan Sealer Application Areas

Courtesy of GENERAL MOTORS COMPANY

2. Apply a 2.25 mm (0.088 in) bead of sealer (1) around the perimeter of the upper oil pan. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Fig. 254: Upper Oil Pan

Courtesy of GENERAL MOTORS COMPANY

3. Install Upper Oil Pan (2)

Fig. 255: Oil Pan Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: Take note that there are different bolt lengths.

4. Coat the oil pan bolts (1) (2) (3) and (4) with teflon pipe sealant prior to installation. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#)
5. Hand tighten Oil Pan Bolts (4) (Qty: 2)
6. Hand tighten Oil Pan Bolts (1) (Qty: 2)
7. Hand tighten Oil Pan Bolts (2, 3) (Qty: 12)

Fig. 256: Upper Oil Pan Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

NOTE: Inspect for excessive sealer around the oil filter mounting area. If extra sealer is present remove and clean accordingly.

8. Tighten Oil Pan Bolts in sequence (Qty: 16) to 10 N.m (89 lb in)
9. Lower the vehicle.
10. Move back the engine into original position.

Fig. 257: Engine Mount, Engine Mount Bracket And Bolts
 Courtesy of GENERAL MOTORS COMPANY

11. Install Engine Mount (4)
12. Install 3 NEW engine mount to body bolts (1, 3) and tighten in two passes:

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

1. First Pass: 100 N.m (74 lb ft)

2. Final Pass: 60 - 75 degrees - **EN-45059** meter
13. Install 2 NEW engine mount to engine mount bracket bolts (2) and tighten in two passes:
 1. First Pass: 100 N.m (74 lb ft)
 2. Final Pass: 60 - 75 degrees - **EN-45059** meter
14. Install Air Cleaner Assembly. Refer to [Air Cleaner Assembly Replacement](#)
15. Remove Engine Support Fixture. Refer to [Engine Support Fixture](#)
16. Raise the vehicle.

Fig. 258: Heater Inlet And Outlet Hose Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

17. Install Heater Inlet and Outlet Hose Bracket (2)
18. Install and tighten Heater Inlet and Outlet Hose Bracket Bolt (1) to 58 N.m (43 lb ft)

Fig. 259: Transmission Converter Cover And Transmission Bolts
Courtesy of GENERAL MOTORS COMPANY

19. Install the transmission converter cover (3).
20. Install and tighten Transmission Bolts (1, 2) (Qty: 3) to 58 N.m (43 lb ft)

Fig. 260: Engine Oil Level Indicator Control Module, Wiring Harness And Bolt
Courtesy of GENERAL MOTORS COMPANY

21. Install Engine Oil Level Indicator Control Module Wiring Harness (2)
22. Install and tighten the drivetrain and front suspension brace bolts (3) to 10 N.m (89 lb in)

Fig. 261: Oil Pump Flow Control Solenoid Valve And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

23. Connect Electrical Connector (2) @ Oil Pump Flow Control Solenoid Valve (1)

Fig. 262: Engine Oil Level Indicator Control Module Wiring Harness And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

24. Connect Electrical Connector (1) @ Engine Oil Level Indicator Control Module Wiring Harness (2)

Fig. 263: Drivetrain And Front Suspension Cradle, Brace And Bolts
Courtesy of GENERAL MOTORS COMPANY

25. Install the drivetrain and front suspension brace (2) to the drivetrain and front suspension cradle (1).
26. Install and tighten the drivetrain and front suspension brace bolts (3) to 58 N.m (43 lb ft)
27. Install Exhaust Muffler. Refer to [Exhaust Muffler Replacement](#)
28. Install Transmission Mount Strut Bracket. Refer to [Transmission Mount Strut Bracket Replacement](#)

Fig. 264: Lower Oil Pan And Locating Pins
Courtesy of GENERAL MOTORS COMPANY

29. Install Lower Oil Pan (2). Refer to [Lower Oil Pan Replacement](#)
30. Install Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
31. Install Front Compartment Air Deflector. Refer to [Front Compartment Air Deflector Replacement](#)
32. Lower the vehicle.
33. Fill the engine oil to the proper level with NEW engine oil. Refer to [Engine Oil and Oil Filter Replacement](#).

LOWER OIL PAN REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Drain the engine oil. Refer to [Engine Oil and Oil Filter Replacement](#)

Fig. 265: Lower Oil Pan And Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Remove the oil pan bolts. (3) (Qty: 12)
4. Loosen the lower oil pan (1) carefully from the upper oil pan, use a suitable tool to pry at the location as

shown (2).

Fig. 266: Lower Oil Pan And Locating Pins
Courtesy of GENERAL MOTORS COMPANY

5. Remove and DISCARD Lower Oil Pan (2)

Installation Procedure

NOTE: The complete installation procedure of the lower oil pan should be completed within 20 minutes.

1. Clean the oil pan sealing surface.

Fig. 267: Lower Oil Pan Sealer Application Areas
Courtesy of GENERAL MOTORS COMPANY

2. Apply a 2.25 mm (0.088 in) bead of sealer (1) around the perimeter of the oil pan. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#)

Fig. 268: Lower Oil Pan And Locating Pins
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Install a NEW oil pan.

3. Install NEW Lower Oil Pan (2)
4. The Pins (1) must fit into the holes.

Fig. 269: Lower Oil Pan And Bolts
 Courtesy of GENERAL MOTORS COMPANY

5. Install and hand tighten the 12 oil pan bolts (3) to the lower oil pan (1).

Fig. 270: Lower Oil Pan Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

6. Tighten the 12 lower oil pan bolts in sequence as shown to 10 N.m (89 lb in).
7. Lower the vehicle.
8. Fill and check the engine oil level. Refer to [Engine Oil and Oil Filter Replacement](#).

ENGINE OIL AND OIL FILTER REPLACEMENT

Special Tools

EN-726-A Oil Filter Wrench

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Raise and support the vehicle. Refer to [Lifting and Jacking the Vehicle](#)
2. Remove Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
3. Place a drain pan under the vehicle.

Fig. 271: Oil Pan Drain Plug And Seal

Courtesy of GENERAL MOTORS COMPANY

4. Remove the oil pan drain plug. (2)

NOTE: **Inspect the oil drain plug seal ring, replace only if damaged.**

5. Remove Oil Pan Drain Plug Seal (1)
6. Drain the engine oil into a suitable container.

Fig. 272: Oil Filter And Wrench

Courtesy of GENERAL MOTORS COMPANY

7. Install the EN-726-A wrench (2) to the oil filter (1).

NOTE: **Ensure that the old oil filter seal has been removed.**

8. Remove and DISCARD the oil filter. (1)

Installation Procedure

Fig. 273: Oil Pan Drain Plug And Seal

Courtesy of GENERAL MOTORS COMPANY

NOTE: Clean and inspect the oil pan drain plug, replace if necessary.

1. Install Oil Pan Drain Plug Seal (1)

CAUTION: Refer to [Component Fastener Tightening Caution](#)

2. Install and tighten Oil Pan Drain Plug (2) to 25 N.m (18 lb ft)

Fig. 274: Oil Filter And Wrench

Courtesy of GENERAL MOTORS COMPANY

3. Clean the engine block sealing surface.
4. Lubricate the NEW oil filter gasket with clean engine oil.
5. Install the **EN-726-A** wrench (2) to the oil filter (1).
6. Install a NEW oil filter and tighten 3/4 to 1 full turn after the gasket makes contact with the sealing surface on the filter mounting flange. (1)
7. Remove the **EN-762-A** wrench (2) from the oil filter (1).
8. Install Front Compartment Splash Shield. Refer to [Front Compartment Splash Shield Replacement](#)
9. Lower the vehicle.

CAUTION: Using engine oils of any viscosity other than those viscosities recommended could result in engine damage.

10. Fill in NEW engine oil. Refer to [Approximate Fluid Capacities](#).
11. Start the engine and allow it to run until the oil pressure control indicator goes off.
12. Check and correct the engine oil level.
13. Reset the GM oil life system. Refer to [GM Oil Life System Resetting](#) [GM Oil Life System Resetting \(With Scan Tool\)](#) .

OIL PUMP FLOW CONTROL SOLENOID VALVE REPLACEMENT

Removal Procedure

1. Remove Lower Oil Pan. Refer to [Lower Oil Pan Replacement](#)

Fig. 275: Oil Pump Flow Control Solenoid Valve, Wiring Harness Plug, Retainer Clamp And Seals
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the wiring harness plug (4) from the oil pump flow control solenoid valve (3)
3. Remove the oil pump flow control solenoid valve retainer clamp (2).
4. Remove the oil pump flow control solenoid valve (3).
5. Remove and DISCARD the 2 oil pump flow control solenoid valve seals (1)

Installation Procedure

Fig. 276: Oil Pump Flow Control Solenoid Valve, Wiring Harness Plug, Retainer Clamp And Seals
Courtesy of GENERAL MOTORS COMPANY

1. Install 2 NEW oil pump flow control solenoid valve seals (1)
2. Install the oil pump flow control solenoid valve (3).
3. Install the oil pump flow control solenoid valve retainer clamp (2).
4. Connect the wiring harness plug (4) to the oil pump flow control solenoid valve (3)
5. Install Lower Oil Pan. Refer to [Lower Oil Pan Replacement](#)

OIL PUMP DRIVE CHAIN REPLACEMENT

Removal Procedure

1. Remove Camshaft Timing Chain. Refer to [Camshaft Timing Chain Replacement](#)
2. Remove Oil Pump. Refer to [Oil Pump Replacement](#)

Fig. 277: Oil Pump Drive Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

3. Tension the oil pump drive chain tensioner (1) in direction of the arrow.
4. Install a suitable locking pin tool into the hole of the oil pump drive chain tensioner (1) as shown in pry (2).

Fig. 278: Oil Pump Drive Chain And Crankshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

5. Remove the oil pump drive chain (1) from the crankshaft sprocket (2).

Installation Procedure

Fig. 279: Oil Pump Drive Chain And Crankshaft Sprocket
Courtesy of GENERAL MOTORS COMPANY

1. Install the oil pump drive chain (1) to the crankshaft sprocket (2).

Fig. 280: Oil Pump Drive Chain Tensioner

Courtesy of GENERAL MOTORS COMPANY

2. Remove the suitable locking pin tool from the oil pump drive chain tensioner (1).
3. Install Oil Pump. Refer to [Oil Pump Replacement](#)
4. Install Camshaft Timing Chain. Refer to [Camshaft Timing Chain Replacement](#)

OIL PUMP DRIVE CHAIN TENSIONER REPLACEMENT

Removal Procedure

1. Remove Engine Front Cover. Refer to [Engine Front Cover Replacement](#)
2. Remove Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)

Fig. 281: Oil Pump Drive Chain Tensioner
Courtesy of GENERAL MOTORS COMPANY

3. Tension the oil pump drive chain tensioner (1) in direction of the arrow.
4. Install a suitable locking pin tool into the hole of the oil pump drive chain tensioner as shown in pry (2).

Fig. 282: Oil Pump Drive Chain Tensioner And Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove the oil pump drive chain tensioner bolt (2).
6. Remove the oil pump drive chain tensioner (1).

Installation Procedure

Fig. 283: Oil Pump Drive Chain Tensioner And Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Install the oil pump drive chain tensioner (1).

CAUTION: Refer to [Fastener Caution](#) .

2. Install the oil pump drive chain tensioner bolt (2) and tighten to 10 N.m (89 lb in).
3. Remove the suitable locking pin tool from the oil pump drive chain tensioner.
4. Install Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)
5. Install Engine Front Cover. Refer to [Engine Front Cover Replacement](#)

OIL PUMP REPLACEMENT

Removal Procedure

1. Remove Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)

Fig. 284: Oil Pump, Bolts, Retainers, Oil Pump Drive Chain And Tensioner
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect the wiring harness plug from the oil pump flow control solenoid valve.
3. Remove Oil Pump Bolts (3) (Qty: 4)
4. Remove and DISCARD the 4 oil pump bolt retainers (2, 4).
5. Release the oil pump drive chain tensioner (6).

NOTE:

- A second technician is required.
- Inspect the correct seat of the oil pump drive chain on the crankshaft sprocket.

6. Move the oil pump assembly (1) in the arrow direction to separate it from the oil pump drive chain (5).

Fig. 285: Oil Pump And Gaskets

Courtesy of GENERAL MOTORS COMPANY

7. Remove and DISCARD the oil pump gasket (2).

8. Remove and DISCARD the oil pump gasket (4).

Disassemble Procedure

Remove Oil Pump Flow Control Solenoid Valve. Refer to [Oil Pump Flow Control Solenoid Valve Replacement](#)

Assemble Procedure

Install Oil Pump Flow Control Solenoid Valve. Refer to [Oil Pump Flow Control Solenoid Valve Replacement](#)

Installation Procedure

Fig. 286: Oil Pump And Gaskets

Courtesy of GENERAL MOTORS COMPANY

1. Install a NEW oil pump gasket (4)
2. Install a NEW oil pump gasket (2)
3. Release the oil pump drive chain tensioner.

NOTE:

- A second technician is required.
- Inspect the correct seat of the oil pump drive chain on the crankshaft sprocket.

4. Install the oil pump assembly (3) with the pins (1).

Fig. 287: Oil Pump, Bolts, Retainers, Oil Pump Drive Chain And Tensioner
 Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

5. Install 4 NEW oil pump bolt retainers (2, 4).
6. Install and tighten Oil Pump Bolts (3) (Qty: 4) to 10 N.m (89 lb in).
7. Connect the wiring harness plug to the oil pump flow control solenoid valve.
8. Install Upper Oil Pan. Refer to [Upper Oil Pan Replacement](#)

ENGINE REPLACEMENT

Special Tools

- **CH-42188-B** Ball Joint Separator
- **CH-51034** Cradle Alignment Guide Pin
- **EN-45059** Angel Meter

Equivalent regional tools: [Special Tools](#)

Removal Procedure

WARNING: Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure will perform the following tasks:

- Identify how to disable high voltage.
- Identify how to test for the presence of high voltage.
- Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Disable the high voltage system. Refer to [High Voltage Disabling](#)
2. Remove Intermediate Steering Shaft Lower Bolt. Refer to [Intermediate Steering Shaft Replacement](#)
3. Recover the refrigerant. Refer to [Refrigerant Recovery and Recharging](#)
4. Drain the drive motor battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#)
5. Drain the drive motor generator power inverter module cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
6. Drain the coolant. Refer to [Cooling System Draining and Filling](#)
7. Remove Intake Manifold Cover. Refer to [Intake Manifold Cover Replacement](#)
8. Remove the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#)
9. Remove the air cleaner outlet duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
10. Remove the radiator surge tank. Refer to [Radiator Surge Tank Replacement](#)
11. Remove 300-Volt Battery Positive and Negative Cable @ Transmission. Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Power Inverter Module and A/C Compressor](#)
12. Remove Engine Wiring Harness Junction Block. Refer to [Engine Wiring Harness Junction Block Replacement](#)

Fig. 288: Ground Cable, Nut, Engine Wiring Harness, Clips And Electrical Connectors

Courtesy of GENERAL MOTORS COMPANY

13. Remove Ground Cable Nut (2)
14. Remove Ground Cable (1)
15. Remove the electrical connector (3) in top direction from the front compartment fuse block housing.
16. Unclip Engine Wiring Harness (5) @ Clips (4) (Qty: 2)
17. Disconnect the electrical connectors. (6, 7) (Qty: 2)

Fig. 289: Fuel Feed Pipe, Fuel Feed Front Pipe And Retainer
Courtesy of GENERAL MOTORS COMPANY

18. Remove Fuel Feed Front Pipe (2) @ Retainer (3)
19. Disconnect Fuel Feed Front Pipe (2) @ Fuel Feed Pipe (1). Refer to [Plastic Collar Quick Connect Fitting Service](#)
20. Close all open connections with the **EN-6015** plugs.

Fig. 290: Evaporative Emission Canister Purge Solenoid Valve And Evaporative Emission Pipe
Courtesy of GENERAL MOTORS COMPANY

21. Disconnect Evaporative Emission Pipe (1) @ Evaporative Emission Canister Purge Solenoid Valve (3). Refer to [Plastic Collar Quick Connect Fitting Service](#)

22. Close all open connections with the **EN-6015** plugs.
23. Remove Heater Water Shutoff Valve Inlet Hose. Refer to [Heater Water Shutoff Valve Inlet Hose Replacement](#)

Fig. 291: Range Selector Lever Cable And Range Selector Lever Cable Lever
Courtesy of GENERAL MOTORS COMPANY

24. Remove Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever

Fig. 292: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

25. Remove Range Selector Lever Cable (1) @ Transmission Range Selector Lever Cable Bracket
26. Release the cable from the bracket by pushing the retainer (arrow).

Fig. 293: Engine Coolant Thermostat Housing, Radiator Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

- 27. Remove Radiator Outlet Hose Clamp (2)
- 28. Remove Radiator Outlet Hose (3) @ Engine Coolant Thermostat Housing (1)

Fig. 294: Water Outlet, Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

- 29. Remove Radiator Inlet Hose Clamp (2)
- 30. Remove Radiator Inlet Hose (1) @ Water Outlet (3)
- 31. Install the engine support fixture. Refer to [**Engine Support Fixture**](#)
- 32. Remove the left side headlamp assembly. Refer to [**Headlamp Replacement**](#)

Fig. 295: Engine Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

33. Unclip Engine Wiring Harness (1) @ Wiring Harness Clips (2) (Qty: 2)

Fig. 296: Wiring Harness Clip And Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

34. Unclip Wiring Harness Clip (2)

CAUTION: In order to prevent any possible electrostatic discharge damage to the ECM, do not touch the connector pins.

35. Disconnect the electrical connectors. (1) (Qty: 3)
 36. Place the engine wiring harness at the top of the engine assembly.

Fig. 297: Engine Ground Strap Bolt And Retainer
Courtesy of GENERAL MOTORS COMPANY

37. Remove the engine ground strap bolt (1).
38. Unclip Wiring Harness Clip (2)
39. Remove Exhaust Muffler. Refer to [Exhaust Muffler Replacement](#)

Fig. 298: Exhaust Front Pipe, Nuts And Gasket
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Do not bend the exhaust flex pipe more than 10 degrees in any direction. Bending of more than 10 degrees or twisting in a range of ± 0.5 degrees will damage the exhaust flex decoupler.

40. Remove Exhaust Front Pipe Nuts (3) (Qty: 2)
41. Remove Exhaust Front Pipe (2)
42. Remove and DISCARD the gasket. (1)

Fig. 299: Heater Inlet Hose And Clamp

Courtesy of GENERAL MOTORS COMPANY

Fig. 301: Heater Inlet Hose, Clamp And Clip
Courtesy of GENERAL MOTORS COMPANY

- 47. Remove Clamp (1)
- 48. Remove Heater Inlet Hose (2)
- 49. Unclip Heater Inlet Hose @ Clip (3)
- 50. Remove Generator Control Module Coolant Pump. Refer to [Generator Control Module Coolant Pump Replacement](#)
- 51. Remove Heater Inlet and Outlet Pipe. Refer to [Heater Inlet And Outlet Pipe Replacement](#)
- 52. Remove Heater Coolant Pump. Refer to [Heater Coolant Pump Replacement](#)
- 53. Remove Heater Coolant Heater. Refer to [Heater Coolant Heater Replacement](#)
- 54. Remove Heater Water Shutoff Valve. Refer to [Heater Water Shutoff Valve Replacement](#)

Fig. 302: Coolant Hose And Clips
Courtesy of GENERAL MOTORS COMPANY

- 55. Remove Clip (1) (Qty: 2)
- 56. Remove Coolant Hose (2)

Fig. 303: Drive Motor Battery Coolant Cooler Inlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

57. Remove the drive motor battery coolant cooler inlet hose (1) from the retainer (2) and reposition.

Fig. 304: Air Conditioning Evaporator Tube, Condenser Tube And Nut
Courtesy of GENERAL MOTORS COMPANY

58. Remove the condenser tube nut (3).

59. Remove the air conditioning evaporator tube (1) along with the condenser tube (2) from the condenser.

Fig. 305: Air Conditioning Compressor, Condenser Hose And Bolt
Courtesy of GENERAL MOTORS COMPANY

60. Remove the air conditioning compressor and condenser hose bolt (1).
61. Remove the air conditioning compressor and condenser hose (2) from the air conditioning compressor (3).

Fig. 306: A/C Compressor And Condenser Hose Tube, Retainer, Wiring Harness And Cycling Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

62. Unclip the retainer (1) holding the air conditioning compressor and condenser hose tube to the engine bracket.
63. Unclip the wiring harness (2) from the air conditioning compressor and condenser hose tube.
64. Disconnect the air conditioning cycling switch electrical connector (3).
65. Remove the air conditioning compressor and condenser hose tube (1).

Fig. 307: Air Conditioning Compressor Hose Bolt And Air Conditioning Evaporator Hose

- 66. Remove the air conditioning compressor hose bolt (1) from the air conditioning evaporator hose (2).
- 67. Remove Air Conditioning Compressor Hose

Fig. 308: Radiator And Lashing Straps
Courtesy of GENERAL MOTORS COMPANY

- 68. Secure the radiator (2) using 2 lashing straps (1)
- 69. Remove Underbody Front Air Deflector-Left Side. Refer to [Underbody Front Air Deflector Replacement - Left Side](#)
- 70. Drain the transmission. Refer to [Transmission Fluid Drain and Fill](#)

Fig. 309: Transmission Fluid Cooler Outlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

71. Place a container beneath the transmission fluid cooler outlet pipe (2) to catch spilling transmission fluid.
72. Remove Transmission Fluid Cooler Pipe Bolt (1)
73. Disconnect Transmission Fluid Cooler Outlet Pipe (2)
74. Remove and DISCARD Sealing Washer (3)

Fig. 310: Transmission Fluid Cooler Inlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

75. Place a container beneath the transmission fluid cooler inlet pipe (3) to catch spilling transmission fluid.
76. Remove Transmission Fluid Cooler Pipe Bolt (1)
77. Disconnect Transmission Fluid Cooler Inlet Pipe (3)
78. Remove and DISCARD Sealing Washer (2)

Fig. 311: Drive Motor Generator Control Module Cooling Outlet Hose And Bolts
Courtesy of GENERAL MOTORS COMPANY

- 79. Remove Drive Motor Generator Control Module Cooling Outlet Hose Bolt (1) (Qty: 2)
- 80. Remove and DISCARD Seal (2)

Fig. 312: Stabilizer Shaft Link, Stabilizer Shaft And Nut
Courtesy of GENERAL MOTORS COMPANY

NOTE: Hold against the hex of the threaded stud to release the nuts. Use a suitable tool.

- 81. Remove and DISCARD Stabilizer Shaft Link Nuts (2) (Qty: 2)
- 82. Disconnect Stabilizer Shaft Links (1) (Qty: 2) @ Stabilizer Shaft (3)

Fig. 313: Steering Knuckle, Lower Ball Joint And Nut
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Support the front suspension under the front lower control arm ball joint with a hydraulic jack to release the nut.

83. Remove and DISCARD Nuts (1) (Qty: 2)
84. Separate the steering knuckle from the lower ball joint. (Qty: 2)
85. Disconnect the outer tie rod from the steering knuckle (Qty: 2). Refer to [Steering Linkage Outer Tie Rod Replacement](#)
86. Reposition away Front Wheel Drive Shaft @ Transmission. Refer to [Front Wheel Drive Shaft Replacement](#)

Fig. 314: Transmission Mount Strut Bolt And Transmission Mount Strut
 Courtesy of GENERAL MOTORS COMPANY

87. Remove and DISCARD Transmission Mount Strut Bolt (1) @ Transmission Mount Strut (2).

Fig. 315: Drivetrain And Front Suspension Cradle Supported With Suitable Hydraulic Jack
Courtesy of GENERAL MOTORS COMPANY

88. Support the drivetrain and front suspension cradle (1) with a suitable hydraulic jack (2).

Fig. 316: Drivetrain And Front Suspension Cradle, Crossmember Extension And Bolts
Courtesy of GENERAL MOTORS COMPANY

NOTE: A second technician is required.

- 89. Remove and DISCARD Bolts (2, 5, 9) (Qty: 6) @ Drivetrain and Front Suspension Cradle (1)
- 90. Remove and DISCARD Bolts (4, 7) (Qty: 2) @ Drivetrain and Front Suspension Crossmember Extension (6)
- 91. Lower the drivetrain and front suspension cradle along with drivetrain and front suspension crossmember extension and both lower control arm (3, 8) as far as necessary to disconnect the wiring harness.

Fig. 317: Power Steering Assist Motor, Electrical Connectors And Wiring Harness Clips
Courtesy of GENERAL MOTORS COMPANY

- 92. Disconnect Electrical Connectors (5) (Qty: 2) @ Power Steering Assist Motor (4)
- 93. Disconnect the electrical connector. (2)
- 94. Unclip Wiring Harness Clip (1, 3, 6) (Qty: 6)

NOTE: **A second technician is required.**

- 95. Carefully lower the drivetrain and front suspension cradle along with drivetrain and front suspension crossmember extension and both lower control arm
- 96. Remove the drivetrain and front suspension cradle along with drivetrain and front suspension crossmember extension and both lower control arm.
- 97. Lower the vehicle.
- 98. Position an engine support table under the powertrain assembly
- 99. Blocks of wood can be used between the front of the frame and the oil pan in order to level the powertrain during the removal.
- 100. With the table positioned, fully raise the table to contact with the powertrain assembly.

Fig. 318: Transmission Mount And Bolts

Courtesy of GENERAL MOTORS COMPANY

101. Remove and DISCARD Transmission Mount Bolts (1) (Qty: 3) @ Transmission Mount (2)

Fig. 319: Engine Mount Bolts

Courtesy of GENERAL MOTORS COMPANY

102. Remove Engine Mount Bolts (1) (Qty: 2)

103. Remove the engine support fixture. Refer to [Engine Support Fixture](#)

104. Slowly and carefully raise the vehicle, ensure the powertrain assembly are free from wiring, hoses and other engine compartment components

Fig. 320: Starter Opening Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

105. Remove Bolts (2) (Qty: 2)

106. Remove the starter opening cover (1).

Fig. 321: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

- 107. Remove the torque converter bolts. (1) (Qty: 4)
- 108. Remove the water outlet. Refer to [Water Outlet Replacement](#)
- 109. Remove Heater Inlet Hose. Refer to [Heater Inlet Hose Replacement](#)

Fig. 322: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

- 110. Remove the transmission bolts. (1) (Qty: 3)

Fig. 323: Transmission Bolt

Courtesy of GENERAL MOTORS COMPANY

111. Remove Transmission Bolt (1)

Fig. 324: Transmission Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

112. Remove Transmission Bolts (1) (Qty: 2)

113. Remove Transmission Cover (2)

114. Properly support engine and transmission as necessary.

Fig. 325: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: These are the last transmission bolts.

115. Remove Transmission Bolts (1) (Qty: 2)
116. Separate the engine from the transmission.
117. Disconnect Engine Coolant Hose as necessary.
118. Disconnect all electrical connectors.
119. Transfer components as necessary.

Installation Procedure

1. Connect all electrical connectors.
2. Connect engine coolant hoses as necessary

Do not tighten bell housing bolts at this time. There must be a small 1 mm (0.039 in) to 2 mm (0.079 in) mm gap between the engine and transmission to allow rotation for input flange alignment

3. Install two appropriate guide pins into the engine to aid aligning the transmission to the engine.

NOTE: A second technician is required.

4. Align the transmission to the engine leaving a 2 millimeter gap between both.

Fig. 326: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove the guide pin, then install the 2 transmission bolt (1) and hand tighten, allowing a small 1 mm (0.039 in) to 2 mm (0.079 in) gap between the engine and transmission.

Fig. 327: Transmission Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

6. Install Transmission Cover (2)
7. Install and hand tighten Transmission Bolts (1) (Qty: 2)

Fig. 328: Transmission Bolt

Courtesy of GENERAL MOTORS COMPANY

8. Install and hand tighten Transmission Bolt (1)

Fig. 329: Transmission Bolts

Courtesy of GENERAL MOTORS COMPANY

9. Install and hand tighten Transmission Bolts (1) (Qty: 3)

Fig. 330: Torque Converter Bolts

Courtesy of GENERAL MOTORS COMPANY

10. Set the engine to TDC allowing the master oblong flexplate bolt hole to appear in the starter hole opening.
11. Install and perform final tightening of the ALL remaining torque convertor bolts and transmission housing to engine bolts as specified in the transmission replacement procedure. Refer to [Transmission Replacement](#)

Fig. 331: Starter Opening Cover And Bolts

Courtesy of GENERAL MOTORS COMPANY

12. Install the starter opening cover (1).
13. Install and tighten Bolts (2) (Qty: 2). Refer to [Transmission Replacement](#)
14. Install the water outlet. Refer to [Water Outlet Replacement](#)
15. Install Heater Inlet Hose. Refer to [Heater Inlet Hose Replacement](#)
16. Slowly and carefully lower the vehicle, ensure the powertrain assembly are free from wiring, hoses and other engine compartment components

Fig. 332: Engine Mount Bolts

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#)

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#)

17. Install and tighten Engine Mount Bolts (1) (Qty: 2). Refer to [Engine Mount Replacement](#)

Fig. 333: Transmission Mount And Bolts

Courtesy of GENERAL MOTORS COMPANY

18. Install and tighten Transmission Mount Bolts (1) (Qty: 3) @ Transmission Mount (2). Refer to [Transmission Mount Replacement](#)

19. Install the engine support fixture. Refer to [Engine Support Fixture](#)

20. Raise the vehicle.

Fig. 334: Drivetrain And Front Suspension Cradle Supported With Suitable Hydraulic Jack
Courtesy of GENERAL MOTORS COMPANY

NOTE: A second technician is required.

21. Raise the drivetrain and front suspension cradle along with drivetrain and front suspension crossmember extension and both lower control arm (1) with a suitable jack (2) as far as necessary to connect the wiring harness.

Fig. 335: Power Steering Assist Motor, Electrical Connectors And Wiring Harness Clips
Courtesy of GENERAL MOTORS COMPANY

22. Install Wiring Harness Clips (1, 3, 6) (Qty: 6)
23. Connect the electrical connector. (2)
24. Connect Electrical Connectors (5) (Qty: 2) @ Power Steering Assist Motor (4)

Fig. 336: Drivetrain And Front Suspension Cradle, Crossmember Extension And Bolts
 Courtesy of GENERAL MOTORS COMPANY

NOTE: A second technician is required.

25. Install the drivetrain and front suspension cradle (1) along with the drivetrain and front suspension crossmember extension (6) and the lower control arm (3, 8) to the vehicle. Refer to [Drivetrain and Front Suspension Cradle Replacement](#)

Fig. 337: Transmission Mount Strut Bolt And Transmission Mount Strut
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Torque-to-Yield Fastener Warning](#)

26. Install and tighten NEW Transmission Mount Strut Bolt (1) @ Transmission Mount Strut (2). Refer to [Transmission Mount Strut Bracket Replacement](#)
27. Install Front Wheel Drive Shaft @ Transmission. Refer to [Front Wheel Drive Shaft Replacement](#)
28. Connect the outer tie rod to the steering knuckle (Qty: 2). Refer to [Steering Linkage Outer Tie Rod Replacement](#)

Fig. 338: Steering Knuckle, Lower Ball Joint And Nut
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Support the lower control arm under the ball joint with a hydraulic jack to tighten the nut.

29. Install the 2 lower ball joint (3) to the steering knuckle (2).
30. Install and tighten Nuts (1) (Qty: 2). Refer to [Lower Control Arm Replacement](#)

Fig. 339: Stabilizer Shaft Link, Stabilizer Shaft And Nut
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Hold against the hex of the threaded stud to tighten the nuts. Use a suitable tool.

31. Connect Stabilizer Shaft Links (1) (Qty: 2) @ Stabilizer Shaft (3)
32. Install and tighten Stabilizer Shaft Link Nuts (2) (Qty: 2) @ Stabilizer Shaft Link (1). Refer to [Lower Control Arm Replacement](#)

Fig. 340: Drive Motor Generator Control Module Cooling Outlet Hose And Bolts
Courtesy of GENERAL MOTORS COMPANY

33. Install NEW Seal (2). Install a NEW seal.
34. Install and tighten Drive Motor Generator Control Module Cooling Outlet Hose Bolts (1) (Qty: 2). Refer to [Drive Motor Generator Control Module Cooling Outlet Hose Replacement \(Underbody Line\) Drive Motor Generator Control Module Cooling Outlet Hose Replacement \(Underbody Line to Traction Power Inverter Module Inlet\)](#)

Fig. 341: Transmission Fluid Cooler Inlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

35. Install NEW Sealing Washer (2). Install a NEW seal.
36. Connect Transmission Fluid Cooler Inlet Pipe (3)
37. Install and tighten Transmission Fluid Cooler Pipe Bolt (1). Refer to [Transmission Fluid Cooler Inlet Pipe Replacement](#)

Fig. 342: Transmission Fluid Cooler Outlet Pipe, Bolt And Sealing Washer
Courtesy of GENERAL MOTORS COMPANY

38. Install NEW Sealing Washer (3). Install a NEW seal.
39. Connect Transmission Fluid Cooler Outlet Pipe (2)
40. Install and tighten Transmission Fluid Cooler Pipe Bolt (1). Refer to [Transmission Fluid Cooler Outlet Pipe Replacement](#)
41. Fill Transmission. Refer to [Transmission Fluid Drain and Fill](#)
42. Install Underbody Front Air Deflector-Left Side. Refer to [Underbody Front Air Deflector Replacement - Left Side](#)

Fig. 343: Radiator And Lashing Straps
Courtesy of GENERAL MOTORS COMPANY

43. Loosen the radiator (2) from the body and remove the ropes (1).

Fig. 344: Air Conditioning Compressor Hose Bolt And Air Conditioning Evaporator Hose
Courtesy of GENERAL MOTORS COMPANY

44. Install Air Conditioning Compressor Hose
45. Install the air conditioning compressor hose bolt (1) to the air conditioning evaporator hose (2) and tighten.
 Refer to [Air Conditioning Compressor Hose Replacement](#)

Fig. 345: A/C Compressor And Condenser Hose Tube, Retainer, Wiring Harness And Cycling Switch Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

46. Install the air conditioning compressor and condenser hose tube (1).
47. Connect the air conditioning cycling switch electrical connector (3).
48. Install the wiring harness (2) to the air conditioning compressor and condenser hose tube.
49. Install the retainer (1).

Fig. 346: Air Conditioning Compressor, Condenser Hose And Bolt
Courtesy of GENERAL MOTORS COMPANY

50. Install the air conditioning compressor and condenser hose (2) to the air conditioning compressor (3).
51. Install the air conditioning compressor and condenser hose bolt (1) and tighten. Refer to [Air Conditioning Compressor and Condenser Hose Replacement](#)

Fig. 347: Air Conditioning Evaporator Tube, Condenser Tube And Nut
Courtesy of GENERAL MOTORS COMPANY

52. Install the air conditioning evaporator tube (1) along with the condenser tube (2) to the condenser.
53. Install the condenser tube nut (3) and tighten. Refer to [Air Conditioning Compressor and Condenser Hose Replacement](#)

Fig. 348: Drive Motor Battery Coolant Cooler Inlet Hose And Retainer
Courtesy of GENERAL MOTORS COMPANY

54. Install the drive motor battery coolant cooler inlet hose (1) to the retainer (2).

Fig. 349: Coolant Hose And Clips
Courtesy of GENERAL MOTORS COMPANY

- 55. Install Coolant Hose (2)
- 56. Install Clips (1) (Qty: 2)
- 57. Install Heater Water Shutoff Valve. Refer to [Heater Water Shutoff Valve Replacement](#)
- 58. Install Heater Coolant Heater. Refer to [Heater Coolant Heater Replacement](#)
- 59. Install Heater Coolant Pump. Refer to [Heater Coolant Pump Replacement](#)
- 60. Install Heater Inlet and Outlet Pipe. Refer to [Heater Inlet And Outlet Pipe Replacement](#)
- 61. Install Generator Control Module Coolant Pump. Refer to [Generator Control Module Coolant Pump Replacement](#)

Fig. 350: Heater Inlet Hose, Clamp And Clip
Courtesy of GENERAL MOTORS COMPANY

- 62. Install Heater Inlet Hose (2)
- 63. Install Clamp (1)
- 64. Install Heater Inlet Hose @ Clip (3)

Fig. 351: Heater Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

- 65. Install Heater Inlet Hose (1)
- 66. Install Clamp (2)

Fig. 352: Exhaust Front Pipe, Nuts And Gasket
Courtesy of GENERAL MOTORS COMPANY

- 67. Install a NEW gasket. (1)
- 68. Install Exhaust Front Pipe (2)
- 69. Install and tighten Exhaust Front Pipe Nuts (3) (Qty: 2). Refer to [Exhaust Front Pipe Replacement](#)
- 70. Install Exhaust Muffler. Refer to [Exhaust Muffler Replacement](#)

Fig. 353: Engine Ground Strap Bolt And Retainer
Courtesy of GENERAL MOTORS COMPANY

- 71. Install the engine ground strap bolt (1) and tighten to 25 N.m (18 lb ft).
- 72. Install Wiring Harness Clip (2)

Fig. 354: Wiring Harness Clip And Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

- 73. Connect the electrical connectors. (1) (Qty: 3)
- 74. Install Wiring Harness Clip (2)

Fig. 355: Engine Wiring Harness And Clips
Courtesy of GENERAL MOTORS COMPANY

- 75. Install Engine Wiring Harness (2) @ Wiring Harness Clips (1) (Qty: 2)
- 76. Install Headlamp Left Side. Refer to [Headlamp Replacement](#)
- 77. Lower the vehicle.
- 78. Remove the engine support fixture. Refer to [Engine Support Fixture](#)

Fig. 356: Water Outlet, Radiator Inlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

- 79. Install Radiator Inlet Hose (1) @ Water Outlet (3)
- 80. Install Radiator Inlet Hose Clamp (2)

Fig. 357: Engine Coolant Thermostat Housing, Radiator Outlet Hose And Clamp
Courtesy of GENERAL MOTORS COMPANY

- 81. Install Radiator Outlet Hose (3) @ Engine Coolant Thermostat Housing (1)
- 82. Install Radiator Outlet Hose Clamp (2)

Fig. 358: Range Selector Lever Cable And Transmission Range Selector Lever Cable Bracket
Courtesy of GENERAL MOTORS COMPANY

83. Install the range selector lever cable (1) to the range selector lever cable bracket.

The retainer snaps automatically in.

Fig. 359: Range Selector Lever Cable And Range Selector Lever Cable Lever
Courtesy of GENERAL MOTORS COMPANY

84. Install Range Selector Lever Cable (1) @ Range Selector Lever Cable Lever

85. Install Heater Water Shutoff Valve Inlet Hose. Refer to [Heater Water Shutoff Valve Inlet Hose Replacement](#)

Fig. 360: Evaporative Emission Canister Purge Solenoid Valve And Evaporative Emission Pipe
Courtesy of GENERAL MOTORS COMPANY

86. Remove all **EN-6015** plugs from the connections.
87. Connect Evaporative Emission Pipe (1) @ Evaporative Emission Canister Purge Solenoid Valve (3). Refer to [**Plastic Collar Quick Connect Fitting Service**](#)

Fig. 361: Fuel Feed Pipe, Fuel Feed Front Pipe And Retainer
Courtesy of GENERAL MOTORS COMPANY

88. Remove all **EN-6015** plugs from the connections.
89. Connect Fuel Feed Front Pipe (2) @ Fuel Feed Pipe (1). Refer to [**Plastic Collar Quick Connect Fitting Service**](#)
90. Install Fuel Feed Front Pipe (2) @ Retainer (3)

Fig. 362: Ground Cable, Nut, Engine Wiring Harness, Clips And Electrical Connectors
Courtesy of GENERAL MOTORS COMPANY

91. Install the electrical connector (3) to the front compartment fuse block housing.
92. Install Ground Cable (1)
93. Install and tighten Ground Cable Nut (2) to 9 N.m (80 lb in)
94. Connect the electrical connectors. (6, 7) (Qty: 2)
95. Install Engine Wiring Harness (5) @ Clips (4) (Qty: 2)
96. Install Engine Wiring Harness Junction Block. Refer to [Engine Wiring Harness Junction Block Replacement](#)
97. Install 300-Volt Battery Positive and Negative Cable @ Transmission. Refer to [Battery 300-Volt Positive and Negative Cable Replacement - High Voltage Battery to Power Inverter Module and A/C Compressor](#)
98. Install the radiator surge tank. Refer to [Radiator Surge Tank Replacement](#)
99. Install the air cleaner outlet duct. Refer to [Air Cleaner Outlet Duct Replacement](#)
100. Install the air cleaner assembly. Refer to [Air Cleaner Assembly Replacement](#)
101. Install Intake Manifold Cover. Refer to [Intake Manifold Cover Replacement](#)
102. Adjust Range Selector Lever Cable. Refer to [Range Selector Lever Cable Adjustment](#)
103. Install Intermediate Steering Shaft Lower Bolt. Refer to [Intermediate Steering Shaft Replacement](#)
104. Fill the cooling system. Refer to [Cooling System Draining and Filling](#)
105. Fill the drive motor generator power inverter module cooling system. Refer to [Drive Motor Generator Power Inverter Module Cooling System Draining and Filling](#)
106. Fill the drive motor battery cooling system. Refer to [Drive Motor Battery Cooling System Draining and Filling](#) -
107. Connect the battery negative cable. Refer to [Battery Negative Cable Disconnection and Connection](#)
108. Recharge the refrigerant. Refer to [Refrigerant Recovery and Recharging](#)
109. Enable the high voltage system. Refer to [High Voltage Enabling](#)

AUTOMATIC TRANSMISSION FLEX PLATE REPLACEMENT

Special Tools

- EN-45059 Angle Meter
- EN-51398 Flywheel Holder

Equivalent regional tools: [Special Tools](#)

Removal Procedure

1. Remove Transmission. Refer to [Transmission Replacement](#)

Fig. 363: Flywheel Holder And Bolts

Courtesy of GENERAL MOTORS COMPANY

2. Install the **EN-51398** holder (1), lock the automatic transmission flex plate via the starter ring gear.
3. Ensure that the **EN-51398** holder is engaged into a robust portion of the flex plate (3).
4. Install and tighten the 2 starter opening cover bolts (2).

Fig. 364: Automatic Transmission Flex Plate And Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove and DISCARD the 8 automatic transmission flex plate bolts (1).
6. Remove Automatic Transmission Flex Plate (2)

Installation Procedure

Fig. 365: Automatic Transmission Flex Plate And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Automatic Transmission Flex Plate (2)
2. Install 8 NEW automatic transmission flex plate bolts (1).
3. Hand tighten the bolts.

Fig. 366: Automatic Transmission Flex Plate Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Fastener Caution](#) .

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#) .

NOTE: The bolts have adhesive patch and must be tightened to final torque within 5 minutes.

4. Tighten Automatic Transmission Flex Plate Bolts in the sequence shown.
 1. First Pass: 20 N.m (15 lb ft).
 2. Second Pass: 30 N.m (22 lb ft).

3. Final Pass: 70 degrees, using the **EN 45059** meter.

Fig. 367: Flywheel Holder And Bolts

Courtesy of GENERAL MOTORS COMPANY

5. Remove the 2 starter opening cover bolts (2).

6. Remove the **EN-51398** holder (1).

7. Install Transmission. Refer to [Transmission Replacement](#)

ENGINE SUPPORT FIXTURE

Fig. 368: Engine Support Fixture Components

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
---------	----------------

Callout	Component Name
Preliminary Procedures 1. Remove Air Cleaner Outlet Duct. Refer to Air Cleaner Outlet Duct Replacement 2. To gain access for the engine support fixture installation, remove the wiring harness from the front compartment upper side rail. 3. To gain access for the engine lift bracket installation, unclip the engine wiring harness from the intake manifold.	
Special Tools • EN-43405 Engine Support Fixture Adapter • EN-28467-1A Cross Bracket • EN-28467-5A Strut Tower Support Assembly • EN-28467-8A Hook Assembly • EN-28467-2A Radiator Tube Shelf Assembly • EN-36857 Engine Lift Bracket	
Equivalent regional tools: Special Tools	
1	Engine Support Fixture Adapter Leg (Qty: 2) Procedure Install the bracket to fender frame. Do not install on top of fender lip.
2	Main Support Beam
3	Cross Bracket (Qty: 2)
4	Strut Tower Support Assembly (Qty: 2) Procedure Adjust the length of the strut tower support assembly.
5	Radiator Tube Shelf Assembly (Qty: 2)
6	Engine Lift Bracket Procedure Use a grade 10.9 bolt to install the EN-36857 Engine Lift Bracket.
7	Hook Assembly (Qty: 2)

REPAIR INSTRUCTIONS - OFF VEHICLE

DRAINING FLUIDS AND OIL FILTER REMOVAL

Fig. 369: Draining Fluids and Oil Filter
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Oil Pan Drain Plug CAUTION: Refer to Fastener Caution . NOTE: Place a drip pan underneath. Allow the oil to drain completely.
2	Oil Filter Special Tools EN-726-A Oil Filter Wrench For equivalent regional tools, refer to Special Tools.
3	Oil Filter Fitting

CRANKSHAFT BALANCER REMOVAL

Fig. 370: Crankshaft Balancer

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the starter opening cover. Refer to Engine Block Disassemble. 2. Install the EN-51760 holder, lock the automatic transmission flex plate via the starter ring gear.	
Special Tools EN-51760 Flywheel HolderFor equivalent regional tools, refer to Special Tools .	
1	Crankshaft Balancer Bolt
2	Crankshaft Balancer Procedure 1. Install the EN-44226-5 protector onto the crankshaft. 2. Install EN-44226-1 holding body and EN-44226-2 remover plate with remover bolt onto the balancer. 3. Counter hold the EN-44226-2 remover plate and turn the remover screw to remove the balancer. Special Tools • EN-44226 Crankshaft Balancer Remover • EN-44226-5 Crankshaft Protector

AUTOMATIC TRANSMISSION FLEX PLATE REMOVAL

Fig. 371: Automatic Transmission Flex Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the starter opening cover. Refer to Engine Block Disassemble. 2. Install EN-51760 holder, lock the automatic transmission flex plate via the starter ring gear.	
Special Tools EN-51760 Flywheel HolderEquivalent regional tools: Special Tools .	
1	Automatic Transmission Flex Plate Bolt (Qty: 8) NOTE: Discard the bolts.
2	Automatic Transmission Flex Plate
3	Crankshaft Position Sensor Reluctor Ring CAUTION: Refer to Crankshaft Position Sensor Reluctor Ring Caution

EXHAUST GAS RECIRCULATION PIPE REMOVAL

Fig. 372: Exhaust Gas Recirculation Pipe
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Exhaust Gas Recirculation Pipe Bolt (Qty: 2)
2	Exhaust Gas Recirculation Pipe Bolt
3	Exhaust Gas Recirculation Pipe Bolt (Qty: 2)
4	Exhaust Gas Recirculation Pipe
5	Exhaust Gas Recirculation Pipe Gasket NOTE: Discard the gasket.
6	Exhaust Gas Recirculation Pipe Gasket NOTE: Discard the gasket.

EXHAUST GAS RECIRCULATION COOLER OUTLET PIPE REMOVAL

Fig. 373: Exhaust Gas Recirculation Cooler Outlet Pipe

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Exhaust Gas Recirculation Cooler Temperature Sensor Procedure Disconnect the temperature sensor nut at the outlet pipe.
2	Exhaust Gas Recirculation Cooler Outlet Pipe Bolt (Qty: 2)
3	Exhaust Gas Recirculation Cooler Outlet Pipe
4	Exhaust Gas Recirculation Cooler Outlet Pipe Gasket NOTE: Discard the gasket.

EXHAUST GAS RECIRCULATION COOLER REMOVAL

Fig. 374: Exhaust Gas Recirculation Cooler
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Exhaust Gas Recirculation Cooler Temperature Sensor Procedure Disconnect the temperature sensor nut at the inlet pipe.
2	Exhaust Gas Recirculation Cooler Water Bypass Outlet Hose Procedure Disconnect the bypass outlet hose at the water pump.
3	Thermostat Bypass Hose Procedure Disconnect the bypass hose at the water outlet.
4	Exhaust Gas Recirculation Cooler Bolt (Qty: 2)
5	Exhaust Gas Recirculation Cooler Bolt
6	Exhaust Gas Recirculation Cooler
7	Exhaust Gas Recirculation Cooler Inlet Pipe Gasket NOTE: Discard the gasket.

EXHAUST GAS RECIRCULATION VALVE REMOVAL

Fig. 375: Exhaust Gas Recirculation Valve
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Exhaust Gas Recirculation Valve Cooling Return Hose Procedure Disconnect the cooling return hose at the water pump inlet adapter.
2	Exhaust Gas Recirculation Valve Bolt (Qty: 3)
3	Exhaust Gas Recirculation Valve
4	Exhaust Gas Recirculation Valve Gasket

WATER PUMP REMOVAL

Fig. 376: Water Pump

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Thermostat Bypass Pipe Bolt (Qty: 2)
2	Water Pump Inlet Hose Fitting
3	Thermostat Bypass Pipe Gasket
4	Water Pump Bolt (Qty: 2)
5	Water Pump Bolt
6	Water Pump
7	Water Pump Housing Gasket

ENGINE WIRING HARNESS ASSEMBLY REMOVAL

Fig. 377: Engine Wiring Harness Assembly
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Wiring Harness Connector Bolt
2	Engine Wiring Harness Bracket Bolt (Qty: 2)
3	Engine Wiring Harness

THROTTLE BODY ASSEMBLY REMOVAL

Fig. 378: Throttle Body Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Throttle Body Bolt (Qty: 4)
2	Throttle Body
3	Throttle Body Gasket

INTAKE MANIFOLD REMOVAL

Fig. 379: Intake Manifold

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Intake Manifold Bolt (Qty: 5) NOTE: Bolt retainers keep the bolts in position on the assembly. Procedure Loosen bolts until disengaged from mount location.
2	Intake Manifold
3	Intake Manifold Gasket

FUEL PUMP REMOVAL

Fig. 380: Fuel Pump

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Fuel Feed Intermediate Pipe Bolt (Qty: 1)
2	Fuel Feed Intermediate Pipe WARNING: Fuel that flows out at high pressure can cause serious injury to the skin and eyes. ALWAYS depressurize the fuel system before removing

Callout	Component Name
	components that are under high fuel pressure. NOTE: Discard the pipe.
3	Fuel Pump Insulator WARNING: The noise cancelling foam component MUST be replaced if it has been exposed to engine fluids. Failure to replace the noise cancelling foam component that has been exposed to engine fluids may result in an engine fire resulting in catastrophic engine damage, and possible injury or death.
4	Fuel Pump Bolt (Qty: 2) CAUTION: Alternately loosen the fuel pump bolts one turn at a

Callout	Component Name
	time until the pump is fully disengaged from fuel pump lifter follower. Trying to remove the pump bolts without even side-to-side loosening may result in pump plunger damage Procedure: Remove the fuel injection pump bolts alternating in steps of one turn each. NOTE: Discard the bolts.
5	Fuel Pump
6	Valve Lifter Follower

ENGINE LIFT AND SIGHT SHIELD BRACKET REMOVAL

Fig. 381: Engine Lift And Sight Shield Bracket

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Engine Lift Bracket Bolt (Qty: 2)
2	Engine Lift Rear Bracket
3	Engine Lift Bracket Bolt (Qty: 2)
4	Engine Lift Front Bracket

WATER OUTLET REMOVAL

Fig. 382: Water Outlet

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Water Outlet Bolt (Qty: 2)
2	Water Outlet
3	Water Outlet Gasket

IGNITION COIL REMOVAL

Fig. 383: Ignition Coil

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Ignition Coil Assembly (Qty: 4)

FUEL RAIL AND INJECTORS REMOVAL

Special Tools

- EN-51146 Fuel Injector Removal/Installation Kit
- EN-51146-100 Fuel Injector Removal Plate
- EN-51146-150 Fuel Injector Removal Adapters

For equivalent regional tools, refer to [Special Tools](#).

WARNING: Refer to [Diesel/Gasoline Vapors Warning](#) .

WARNING: Refer to [Safety Goggles and Fuel Warning](#) .

NOTE: Maintain a clean work surface when working with fuel rail and fuel injectors. Use care to avoid contaminants on the injector seals.

Fig. 384: Fuel Injector Screw And Adapters
Courtesy of GENERAL MOTORS COMPANY

NOTE: Remove only one fuel injector screw (2) to perform the length check.

1. Ensure the **EN-51146-150** fuel injector removal adapters (1) are used with non-turbocharger applications. Match the length (a) of the **EN-51146-150** adapters (1) to the length of the fuel injector screw (2). If the length does not match, refer to the Turbocharger procedure.

Fig. 385: Adapters And Supports

Courtesy of GENERAL MOTORS COMPANY

2. Install the **EN-51146-150** adapters (2) to the **EN-51146-1-1** supports (1) and tighten to 7 N.m (62 lb in).

Fig. 386: Inner Fuel Injector Screw

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not loosen or remove both fuel injector screws for an individual fuel injector at the same time. Ensure the EN-51146-150 adapter and EN-51146-1-1 support is properly installed on the inner fuel injector screw location before removing the remaining outer fuel injector screw. Ensure the screws do not fall into the cylinder head slot.

3. Remove the inner fuel injector screw (1).
4. Install one **EN-51146-150** adapter and **EN-51146-1-1** support (2) and tighten to 5 N.m (44 lb in).

Fig. 387: Outer Fuel Injector Screw
Courtesy of GENERAL MOTORS COMPANY

5. Remove the outer fuel injector screw (1).
6. Install a second **EN-51146-150** adapter and **EN-51146-1-1** support (2) and tighten to 5 N.m (44 lb in).

Fig. 388: Supports

Courtesy of GENERAL MOTORS COMPANY

7. Using the same procedure, install the remaining **EN-51146-150** adapters and **EN-51146-1-1** supports (1) for each fuel injector and tighten to 5 N.m (44 lb in).

Fig. 389: Upper And Lower Fuel Rail Assembly Bolts

Courtesy of GENERAL MOTORS COMPANY

NOTE: The fuel rail bolts may remain with the decoupling elements and retainer at the fuel rail assembly.

8. Loosen the 4 upper fuel rail assembly bolts (1) completely from the cylinder head, but do not remove the bolts.
9. Loosen the 4 lower fuel rail assembly bolts (2) completely from the cylinder head, but do not remove the bolts.

Fig. 390: Plate, Supports, Bolts And Slide Hammers

Courtesy of GENERAL MOTORS COMPANY

10. Install **EN-51146-100** plate (2) to the **EN-51146-1-1** supports (1) using the eight plate bolts (3). Counterhold each support with a wrench while tightening the bolt.
11. Install the **EN-51146-1-3** slide hammers (4) onto the **EN-51146-100** plate (2) using the outer holes.

Fig. 391: Removing Fuel Injectors

Courtesy of GENERAL MOTORS COMPANY

NOTE: The alignment of the fuel injectors within the cylinder bores is critical for fuel injection system function. Use equal force on each slide hammer to ensure the fuel injectors are removed without tilting in the injector bore.

12. Using the **EN-51146-1-3** slide hammers (1, 2), begin to remove the fuel injectors by applying slight force equally on both hammers. Observe the alignment of the fuel injectors, and allocate force on the hammers as necessary.

NOTE: After removing the fuel rail and injector assembly, position the assembly on a clean work surface with the fuel injectors on top. Do not allow the weight of the assembly to rest on the fuel injectors.

13. Complete the removal of the fuel rail and injector assembly with the **EN-51146** remover. The slide hammers may then be removed from the plate.
14. Install the **EN-51146-2-5** calibration tools onto the fuel injector tips to protect the injectors.
15. Cover the fuel injector bores at the cylinder head to prevent contamination.

CAMSHAFT COVER REMOVAL

Camshaft Cover and Gasket Removal

Fig. 392: Camshaft Cover And Gasket

Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover and Gasket Removal

Callout	Component Name
1	Oil Level Indicator
2	Camshaft Cover Stud (Qty: 2)
3	Camshaft Cover Bolt (Qty: 18)
4	Camshaft Cover Procedure Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant
5	Camshaft Cover Gasket

Camshaft Cover Components Removal

Fig. 393: Camshaft Cover Components

Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover Components Removal

Callout	Component Name
1	Positive Crankcase Ventilation Valve Bolt (Qty: 2) NOTE: Bolts are tamper-proof. Remove the bolts only if inspection of the PCV tube or valves indicates replacement is necessary. Procedure 1. Using a suitable tool, cut a slot in the tamper-proof PCV bolt heads and remove with a

Callout	Component Name
	flat-bladed tool. 2. Discard the bolts.
2	Positive Crankcase Ventilation Tube with Positive Crankcase Ventilation Valve - Fresh Air NOTE: These components have tamper-proof connections and cannot be disassembled. Remove this component only if inspection indicates replacement is necessary. The PCV tube to fresh air inlet duct connection is tamper-proof, and the inlet duct must be replaced when servicing PCV valve components. Procedure 1. Inspect all PCV components and the fresh air inlet duct prior to removal. Do not remove the PCV components or inlet duct unless a diagnostic or inspection procedure indicates replacement is necessary. 2. Complete all camshaft cover inspections prior to inspecting or removing PCV components. If inspection indicates the camshaft cover requires replacement, all PCV components and inlet duct will be replaced with the cover.
3	Camshaft Position Sensor Bolt
4	Intake Camshaft Position Sensor
5	Camshaft Position Sensor Bolt
6	Exhaust Camshaft Position Sensor
7	Camshaft Cover Locating Pin (Qty: 2)
8	Camshaft Position Actuator Solenoid Valve Bolt
9	Camshaft Position Actuator Solenoid Valve
10	Camshaft Position Actuator Solenoid Valve Bolt

Callout	Component Name
11	Camshaft Position Actuator Solenoid Valve

OIL PAN REMOVAL

Fig. 394: Oil Pan
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Lower Oil Pan Bolt (Qty: 12)
2	Lower Oil Pan Procedure Remove the oil pan drain plug, if applicable. Discard the lower oil pan.
3	Oil Pan Bolt (Qty: 2)
4	Oil Pan Bolt (Qty: 12)
5	Oil Pan Bolt (Qty: 2)
6	Wiring Harness Connector Bolt
7	Wiring Harness Connector Procedure Disconnect the oil pump control valve connector, then remove through the upper oil pan.
8	Upper Oil Pan Assembly

ENGINE FRONT COVER REMOVAL

Fig. 395: Engine Front Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Engine Front Cover Bolt (Qty: 1)
2	Engine Front Cover Bolt (Qty: 1)
3	Engine Front Cover Bolt (Qty: 11)
4	Engine Front Cover Stud (Qty: 1)
5	Engine Front Cover Procedure 1. Locate pry-points on the engine front cover to loosen the cover from the engine block. 2. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant 3. Clean and inspect the engine front cover mating surface.
6	Crankshaft Front Oil Seal Procedure Discard the seal. Special Tools EN-51096 Crankshaft Seal Remover For equivalent regional tools, refer to Special Tools.

Callout	Component Name
7	Engine Front Cover Hole Plug

CAMSHAFT TIMING CHAIN REMOVAL

Fig. 396: Camshaft Timing Chain
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Timing Chain Guide Bolt (Qty: 2)
2	Timing Chain Guide - to Cylinder Head
3	Timing Chain Tensioner Bolt (Qty: 2)
4	Timing Chain Tensioner Assembly
5	Timing Chain Tensioner Gasket
6	Timing Chain Tensioner Shoe Bolt (Qty: 1)
7	Timing Chain Tensioner Shoe Assembly
8	Timing Chain Guide Bolt (Qty: 3)
9	Timing Chain Guide - Exhaust Side
10	Timing Chain
11	Timing Chain Oil Nozzle

INTAKE AND EXHAUST CAMSHAFT, BEARING CAP, AND LASH ADJUSTER REMOVAL

Camshaft Actuator Removal

Fig. 397: Camshaft Actuator
Courtesy of GENERAL MOTORS COMPANY

Camshaft Actuator Removal

Callout	Component Name
Preliminary Procedure Install the EN-51367 camshaft locking tool.	
Special Tools EN-51367 Camshaft Locking Tool For equivalent regional tools, refer to Special Tools .	
1	Camshaft Position Actuator Bolt NOTE: Discard bolt.
2	Camshaft Position Actuator - Intake
3	Camshaft Position Actuator Bolt NOTE: Discard bolt.
4	Camshaft Position Actuator - Exhaust

Camshaft Bearings and Camshaft Removal

Fig. 398: Camshaft Bearings and Camshaft
Courtesy of GENERAL MOTORS COMPANY

Camshaft Bearings and Camshaft Removal

Callout	Component Name
Preliminary Procedure	
NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces.	
1. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.	

Callout	Component Name
2. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.	
1	Camshaft Bearing Cap Bolt - Intake Side (Qty: 12) Procedure Loosen each bolt 1/2 turn to reduce spring pressure.
2	Camshaft Bearing Front Intake Cap
3	Camshaft Bearing Cap - Intake Side (Qty: 4) NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location.
4	Camshaft Bearing Rear Cap - Intake Side
5	Intake Camshaft Assembly
6	Camshaft Bearing Cap Bolt - Exhaust Side (Qty: 12) Procedure Loosen each bolt 1/2 turn to reduce spring pressure.
7	Camshaft Bearing Front Exhaust Cap.
8	Camshaft Bearing Cap - Exhaust Side (Qty: 5) NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location.
9	Exhaust Camshaft Assembly

Valve Rocker Arm and Lash Adjuster Removal

Fig. 399: Valve Rocker Arm and Lash Adjuster
 Courtesy of GENERAL MOTORS COMPANY

Valve Rocker Arm and Lash Adjuster Removal

Callout	Component Name
Preliminary Procedure NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces. 1. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts. 2. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.	

CYLINDER HEAD REMOVAL

Fig. 400: Cylinder Head (With Loosening/Tightening Sequence)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Cylinder Head Bolt (Qty: 10) Procedure Remove the bolts in sequence. Discard the bolts.
2	Cylinder Head Assembly
3	Cylinder Head Gasket

OIL PUMP DRIVE CHAIN AND OIL PUMP REMOVAL

Oil Pump Drive Chain and Crankshaft Sprocket Removal

Fig. 401: Oil Pump Drive Chain and Crankshaft Sprocket
 Courtesy of GENERAL MOTORS COMPANY

Oil Pump Drive Chain and Crankshaft Sprocket Removal

Callout	Component Name
1	Oil Pump Drive Chain Tensioner Bolt
2	Oil Pump Drive Chain Tensioner
3	Oil Pump Drive Chain Procedure Loosen the oil pump assembly bolts and tilt the oil pump assembly in order to remove the drive chain.
4	Crankshaft Balancer Key
5	Crankshaft Sprocket

Oil Pump Assembly Removal

Fig. 402: Oil Pump Assembly

Courtesy of GENERAL MOTORS COMPANY

Oil Pump Assembly Removal

Callout	Component Name
1	Oil Pump Flow Control Solenoid Valve Retainer
2	Oil Pump Flow Control Solenoid Valve
3	Oil Pump Assembly Bolt (Qty: 4)
4	Oil Pump Assembly
5	Oil Pump Gasket
6	Oil Pump Gasket

CRANKSHAFT OIL DEFLECTOR REMOVAL

Fig. 403: Crankshaft Oil Deflector

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Positive Crankcase Ventilation Oil Separator Drain Pipe Bolt
2	Positive Crankcase Ventilation Oil Separator Drain Pipe
3	Crankshaft Oil Deflector Bolt (Qty: 3)
4	Crankshaft Oil Deflector

LOWER CRANKCASE REMOVAL

Fig. 404: Lower Crankcase (With Bolt Removal Sequence)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Lower Crankcase Bolt - Perimeter (Qty: 13)
2	Lower Crankcase Bolt (Qty: 10) Procedure Remove bolts in sequence. Discard the bolts.
3	Lower Crankcase

PISTON, CONNECTING ROD, AND BEARING REMOVAL

Fig. 405: Piston, Connecting Rod and Bearing
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces. 1. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts. 2. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary. 3. Before removing the connecting rods, check the connecting rod side clearance using the following	

Callout	Component Name
	procedure: 1. Tap the connecting rod to one end of the crankshaft journal with a dead-blow or wooden hammer. 2. Using feeler gauges, measure the clearance between the crankshaft counterweight and the connecting rod. 3. The connecting rod side clearance should not exceed specifications. Refer to Engine Mechanical Specifications 4. If the end play exceeds the specified limits, measure the width of the crankpin end of the connecting rod. Refer to Piston, Connecting Rod, and Bearing Cleaning and Inspection. 5. If the connecting rod width is significantly smaller than specified and severe wear is present on the side of the connecting rod, replace the connecting rod. 6. If the connecting rod width is within specification and excessive scoring is present on the crankshaft journals, replace the crankshaft. NOTE: An arrow/dot showing proper piston orientation is located on the top of the piston. 4. Using a marker, number each piston face. Draw an arrow along the centerline of the piston pointing toward the front of the engine. CAUTION: Do not use a stamp, punch or any other method that may distort or stress the connecting rod or connecting rod cap. Extensive engine damage may result from a connecting rod that is distorted or stressed. 5. Mark the cylinder number on the connecting rod and the connecting rod cap with a scribe, paint stick or permanent marker.

Callout	Component Name
1	Connecting Rod Bolt (Qty: 8) CAUTION: Powdered metal connecting rods have rod bolts which yield when torqued. If the rod bolts are loosened or removed the rod bolts must be replaced. Rod bolts that are not replaced will not torque to the correct clamp load and can lead to serious engine damage. Procedure DO NOT use the bolts for reinstallation. The bolts may be used to keep the parts together and for inspection and specification measurements.
2	Connecting Rod Assembly (Qty: 4) NOTE: The connecting rod caps must remain with the original connecting rod. The caps must be oriented identical to original installation. Procedure

Callout	Component Name
	Mark the side of the rod with a line that crosses the interface of the rod and cap. Use this line to ensure that the cap and rod are reinstalled in the same orientation.
3	Connecting Rod Bearing (Qty: 4) NOTE: If the connecting rod bearings have been used in a running engine, you must replace them with NEW connecting rod bearings for reassembly.
4	Connecting Rod Bearing (Qty: 4) NOTE: If the connecting rod bearings have been used in a running engine, you must replace them with NEW connecting rod bearings for reassembly.
5	Connecting Rod Assembly (Qty: 4) NOTE: Piston assembly attached. Procedure Using the EN-51454 guides, push the connecting rod and piston assembly through the top of the cylinder. DO NOT scratch the crankshaft journal or cylinder wall and DO NOT damage the oil jets when removing the connecting rod and piston assembly. Special Tools EN-51454 Connecting Rod Guides

Callout	Component Name
	For equivalent regional tools, refer to Special Tools .

CRANKSHAFT AND BEARING REMOVAL

Fig. 406: Crankshaft and Bearing
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Lower Bearing (Qty: 5) NOTE: • Crankshaft bearings MUST be separated, marked, or organized in a way to ensure installation to their original

Callout	Component Name
	location and position, when suitable for use. If the lower half of the bearing is worn or damaged, both upper and lower halves should be replaced.
2	Crankshaft Assembly
3	Crankshaft Rear Oil Seal
4	Crankshaft Upper Bearing (Qty: 4)
5	Crankshaft Thrust Upper Bearing

CYLINDER HEAD DISASSEMBLE

Special Tools

- **EN-8062** Valve Spring Compressor
- **EN-43963** Valve Spring Compressor - Off-Car Adapter
- **EN-46116** Valve Seal Remover
- **EN-46122** Camshaft Position Actuator Check-Ball Valve Remover/Installer

For equivalent regional tools, refer to [Special Tools](#).

Intake and Exhaust Valve Components Removal

Fig. 407: Spark Plugs

Courtesy of GENERAL MOTORS COMPANY

1. Remove the spark plugs (1).

Fig. 408: Special Tool To Remove/Install Valve Stem Keys

Courtesy of GENERAL MOTORS COMPANY

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs less than 25.0 mm (0.984 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

NOTE:

- Many internal engine components will develop specific wear patterns on their friction surfaces.
- Components **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.
- Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.

2. Using **EN-8062** compressor and **EN-43963** adapter, compress the upper valve spring retainer down until the valve stem keys are discharged from spring load. Use a suitable tool and a bit of grease to remove the valve stem keys (1).

Fig. 409: Valve Spring Retainer, Valve Spring And Oil Seal
 Courtesy of GENERAL MOTORS COMPANY

3. Slowly release the **EN-8062** compressor from the valve spring assembly. Remove the valve spring retainer (1) and the valve spring (2).
4. Repeat the procedure for all valve stem keys, valve spring retainers, and valve springs.

CAUTION: Do not damage the valve guide. Remove any burrs that have formed at the key groove by chamfering the valve stem with an oil stone or a file.

5. Using **EN-46116** remover, remove the valve stem oil seals (3). Discard all used seals and replace with new.

Fig. 410: Exhaust And Intake Valves
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Components **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.

6. Remove the 8 exhaust valves (1) and the 8 intake valves (2) from the cylinder head.

Engine Oil Manifold Check Valve Removal

1. Inspect the oil manifold check valves. Damaged, restricted or clogged check valves must be replaced. If check valves are OK, disregard the remaining steps which detail replacing the check valves.

Fig. 411: Oil Manifold Check Valve, Check Ball Spring And Check Ball
Courtesy of GENERAL MOTORS COMPANY

2. Insert a punch or drift into the check valve. With moderate pressure, seat the punch into the inner body of the check valve, and remove the upper part of the valve (1).
3. Remove the check ball spring (2) and check ball (3) from inside of the check valve.

Fig. 412: Setting Depth Gauge On Drill Bit
Courtesy of GENERAL MOTORS COMPANY

4. Using **EN-46122-3** drill bit (1), drill the remainder of check valve sleeve to a depth of approximately 19 mm (0.75 in) (a) by placing tape on drill bit as a depth gauge. It is not necessary or desirable to drill completely through the bottom of the check valve.

Fig. 413: Tapping Drilled Out Portion Of Oil Manifold Check Valve
Courtesy of GENERAL MOTORS COMPANY

5. Lubricate **EN-46122-4** tap (1) with lubricant. Tap drilled out portion of check valve remaining in cylinder head. Tap to full depth possible until tap bottoms out in head.

Fig. 414: Special Tool To Remove Oil Manifold Check Valve Sleeve From Cylinder Head
Courtesy of GENERAL MOTORS COMPANY

6. Assemble **EN-46122-2** bolt, nut, washers, and collar (1). Position collar with slightly-larger inside diameter DOWN toward the cylinder head.
7. Screw bolt by hand fully down into threaded check valve sleeve, then lightly tighten nut against washer.
8. Hold bolt with one wrench, and use another to tighten the nut until the check valve sleeve is removed from the cylinder head.
9. Clean check valve bore and related passages thoroughly to remove any drilling chips or other debris.

Cylinder Head Disassemble

Fig. 415: Cylinder Head Core Hole Plugs, Oil Gallery Plugs And Oil Gallery Restrictor
Courtesy of GENERAL MOTORS COMPANY

1. Remove 4 cylinder head core hole plugs (1) from the top of the cylinder head.
2. Remove 2 cylinder head oil gallery plugs (3).
3. Remove the cylinder head oil gallery restrictor (2).
4. Remove the cylinder head core hole plug (4) from the front of the cylinder head.

Fig. 416: Side Cylinder Head Oil Gallery Plugs And Studs
Courtesy of GENERAL MOTORS COMPANY

5. Remove 2 cylinder head oil gallery plugs (1) from the side of the cylinder head.
6. Remove 4 catalytic converter studs (2). Discard the studs.

Fig. 417: Cylinder Head Core Hole Plugs

Courtesy of GENERAL MOTORS COMPANY

7. Remove the 2 cylinder head core hole plugs (1) from the rear of the cylinder head.

CYLINDER HEAD CLEANING AND INSPECTION

Special Tools

- **EN-22738-B** Valve Spring Tester
- **EN-28410** Gasket Remover
- **GE-7872** Magnetic Base Dial Indicator

For equivalent regional tools, refer to **Special Tools**.

Valve Cleaning and Inspection

Fig. 418: Valve Inspection Areas

Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not use a wire brush on any part of the valve stem.

NOTE: Do not grind or condition the intake valve. If the intake valve is out of specification, replace the valve.

1. Clean the valves of carbon, oil and varnish. Use a soft bristle wire brush to clean any carbon build-up from the valve head. Varnish can be removed by soaking in Parts Immersion Solvent or equivalent. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
2. Clean the valve guides.
3. Inspect the valve stem for pitting or wear (4).
4. Inspect the valve key groove for chipping or wear (5). Replace the valve if chipped or worn.
5. Inspect the valve face for burning or cracking (1). If pieces are broken off, inspect the corresponding piston and cylinder head area for damage.
6. Inspect the valve stem for burrs and scratches. Burrs and minor scratches may be removed with an oil stone.
7. Inspect the valve stem for straightness (3) and the valve head for bending or distortion using V blocks. Bent or distorted valves must be replaced.
8. Clean the deposits from the valve face. Inspect the valve face for grooving.
9. Replace the valve if the face is grooved. Valve faces cannot be machined. If worn, or damaged, the valves must

be replaced.

10. Replace the valve if the valve head O.D. and chamfer (2) is worn or out of specification. Refer to [Valve and Seat Grinding](#).
11. The valves may be lightly lapped to the valve seats.
12. Replace the valve if the valve tip (6) is worn.
13. If no apparent wear, pitting, grooving, or distortion is present, perform the valve measurement and reconditioning procedure to verify valve specification. Refer to [Valve and Seat Grinding](#).

Valve Guide Measurement

Fig. 419: Inspecting For Excessive Valve Stem To Guide Clearance

Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve stem (1) to-guide (2) clearance. Excessive valve stem-to-guide clearance may cause an excessive oil consumption and may also cause a valve to break. Insufficient clearance will result in noisy and sticky functioning of the valve and will disturb the engine assembly smoothness.
2. Clamp the **GE-7872** indicator to the cylinder head at the camshaft cover rail.
3. Locate the dial indicator so that the movement of the valve stem from side to side, crossways to the cylinder head, will cause a direct movement of the indicator stem. The dial indicator stem must contact the side of the valve stem just above the valve guide.
4. Drop the valve head about 0.064 mm (0.0025 in) off the valve seat.
5. Use light pressure when moving the valve stem from side to side in order to obtain a clearance reading. Refer

to [Engine Mechanical Specifications](#) for proper clearance.

NOTE: Valve guide wear at the bottom 10 mm (0.390 in) of the valve guide is not significant to normal operation.

6. If the clearance for the valve is greater than specifications and a new standard diameter valve stem will not bring the clearance within specifications, replace the cylinder head.

Valve Spring Cleaning and Inspection

1. Clean the valve springs in solvent.

WARNING: Refer to [Safety Glasses Warning](#) .

2. Dry the valve springs with compressed air.
3. Inspect the valve springs for broken coils or coil ends.

Fig. 420: Measuring Valve Spring Tension

Courtesy of GENERAL MOTORS COMPANY

4. Measure the valve spring tension using the EN-22738-B tester. Refer to [Engine Mechanical Specifications](#)
5. If low valve spring load is found, replace the valve springs. DO NOT use shims to increase spring load. The use of shims can cause the valve spring to bottom out before the camshaft lobe is at peak lift.

Valve Rocker Arm Cleaning and Inspection

Fig. 421: Inspecting Valve Rocker Arms

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the camshaft follower roller (1) for the following:
 - Flat spots
 - Excessive scoring and pitting
 - Ensure the roller spins freely
2. Inspect the camshaft follower valve tip area (2).
3. Inspect the camshaft follower stationary hydraulic lash adjuster (SHLA) pivot area (3).
4. Replace the camshaft follower or followers as necessary.

Cylinder Head and Gasket Surface Cleaning and Inspection

1. Inspect the cylinder head gasket and mating surfaces for leaks, corrosion and blow-by. If the gasket has failed, use the following faults to determine the cause:
 1. Improper installation
 2. Loose or warped cylinder head
 3. Missing, off location or not fully seated dowel pins

4. Corrosion in the seal area around the coolant passages
5. Chips or debris in the cylinder head bolt holes
6. Bolt holes in the cylinder block not drilled or tapped deep enough

Fig. 422: Inspecting Fuel Injector Bores

Courtesy of GENERAL MOTORS COMPANY

2. Inspect the fuel injector bores and clean, if required. Refer to [Fuel Injector and Fuel Injector Bore Cleaning and Inspection](#).
3. Inspect the cylinder head gasket surface.
 - Cylinder head may be reused if corrosion is found only outside a 4 mm (0.375 in) band around each combustion chamber (1).
 - Replace the cylinder head if the area between the valve seats is cracked (2).
 - Replace the cylinder head if corrosion has been found inside a 4 mm (0.375 in) band around each combustion chamber (3).
4. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to [Use of Room Temperature Vulcanizing \(RTV\) and Anaerobic Sealant](#)

NOTE: Do not use a wire brush on any gasket sealing surface.

5. Clean the cylinder head. Remove all varnish, soot and carbon to the bare metal.
6. Remove any old thread sealant, gasket material or sealant using **EN-28410** remover.

7. Clean all cylinder head surfaces with non-corrosive solvent.
8. Blow out all the oil galleries using compressed air.
9. Clean any debris or build-up from the lifter pockets.
10. Clean the valve guides.
11. Clean the threaded holes. Use a nylon bristle brush.
12. Clean the remains of the sealer from the plug holes.
13. Inspect the cylinder head for cracks. Check between the valve seats and in the exhaust ports.

NOTE: Do not attempt to weld the cylinder head, replace it.

14. Inspect the cylinder head deck for corrosion, sand inclusions and blow holes.
15. Inspect all the threaded holes for damage. Threads may be reconditioned with thread inserts.
16. Inspect the sealing surfaces.
17. Inspect the cylinder head plugs and verify the oil orifice is clear and free of debris.

Cylinder Head Deck Flatness Inspection

Fig. 423: Inspecting Cylinder Head Deck Surface For Flatness
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the cylinder head decks are clean and free of gasket material.

2. Inspect the surface for any imperfections or scratches that could inhibit proper cylinder head gasket sealing.
3. Using a straight-edge placed diagonally across the deck surface, inspect the cylinder head deck surface for flatness.
4. Measure the clearance between the straight-edge and the cylinder head deck face using a feeler gauge at 4 points along the straight-edge.
5. Refer to [Engine Mechanical Specifications](#) If the cylinder head deck flatness is more than the specified amount, replace the cylinder head.

Camshaft Journal Clearance

1. Install the camshaft bearing cap in the cylinder head without the camshaft.

CAUTION: Refer to [Fastener Caution](#) .

2. Install the camshaft cap bolts and tighten to 10 N.m (89 lb in).
3. Measure the camshaft bearings using an inside micrometer.
4. Subtract the camshaft journal diameter from the camshaft bearing diameter. This will provide the running clearance. If the running clearance exceeds specifications and the camshaft journals are within specification, replace the cylinder head. Refer to [Engine Mechanical Specifications](#)
5. Remove the camshaft bearing caps when measurement is complete.

Camshaft Journal Alignment

1. Ensure the camshafts are serviceable.
2. Inspect the cylinder head camshaft bearing surfaces for any imperfections or scratches that could inhibit proper camshaft clearances. Repair minor imperfections or scratches.
3. Install the camshafts in the cylinder head.
4. Install the camshaft bearing caps.
5. Install the camshaft cap bolts and tighten to 10 N.m (89 lb in).
6. Ensure the camshafts spin freely in the cylinder head. If the camshaft does not run freely, replace the cylinder head.

VALVE AND SEAT GRINDING

Valve Measurement and Reconditioning Overview

- Proper valve service is critical to engine performance. Therefore, all detailed measurement procedures must be followed to identify components that are out of specification.
- If the measurement procedures reveal that the valve or valve seat must be reconditioned, it is critical to perform the measurement procedures after reconditioning.

Valve Seat Width Measurement Procedure

Fig. 424: Measuring Valve Seat Width In Cylinder Head
Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve seat width in the cylinder head using a proper scale.

Fig. 425: Measuring Valve Length Using Slide Gauge
Courtesy of GENERAL MOTORS COMPANY

2. Measure the valve length (2). Use a slide gauge (1). Refer to [Engine Mechanical Specifications](#).

Fig. 426: Measuring Valve Stem Diameter Using Micrometer Gauge
Courtesy of GENERAL MOTORS COMPANY

3. Measure the valve stem diameter (1). Use a micrometer gauge (2). Refer to **Engine Mechanical Specifications**.

Fig. 427: Valve Face Seat Width

Courtesy of GENERAL MOTORS COMPANY

4. Measure the seat width (b) on the valve face (1) using a proper scale.

NOTE: The seat contact area must be at least 0.5 mm (0.020 in) from the outer diameter, margin (a), of the valve. If the contact area is too close to the margins, the seat must be reconditioned to move the contact area away from the margin.

5. Compare your measurements with the specifications listed in [Engine Mechanical Specifications](#).
6. If the seat widths are acceptable, check the valve seat roundness using the Valve Seat Roundness Measurement Procedure.
7. If the seat width is not acceptable, you must grind the valve seat using the Valve and Seat Reconditioning Procedure to bring the width back into specification. Proper valve seat width is critical to providing the correct amount of valve heat dissipation.

Valve Seat Roundness Measurement Procedure

1. Measure the valve seat roundness using a dial indicator attached to a tapered pilot installed in the guide. The pilot should have a slight bind when installed in the guide.

CAUTION: The correct size pilot must be used. Do not use adjustable diameter pilots.

Adjustable pilots may damage the valve guides.

2. Compare your measurements with the specifications listed in [Engine Mechanical Specifications](#).
3. If the valve seat exceeds the roundness specification, you must grind the valve and valve seat using the Valve and Seat Reconditioning Procedure.
4. If new valves are being used, the valve seat roundness must be within 0.05 mm (0.002 in).

Valve Head O.D. and Chamfer Measurement Procedure

Fig. 428: View Of Valve Head O.D. & Chamfer
Courtesy of GENERAL MOTORS COMPANY

1. Measure the valve head O.D. and chamfer (a) using an appropriate scale. Refer to [Engine Mechanical Specifications](#).
2. If the valve head O.D. and chamfer is within specification, test the valve (1) for seat concentricity using the Valve-to-Seat Concentricity Measurement Procedure. Reinspect the valve head O.D. and chamfer after completing the concentricity measurement if valve seat reconditioning is performed.

Valve-to-Seat Concentricity Measurement Procedure

NOTE:

- Checking the valve-to-seat concentricity determines whether the valve and seat are sealing properly.
- You must measure the valve face and the valve seat to ensure proper

valve sealing.

Fig. 429: Inspecting Valve Face

Courtesy of GENERAL MOTORS COMPANY

1. Coat the valve face (3) lightly with blue dye (1).
2. Install the valve in the cylinder head.
3. Turn the valve against the seat with enough pressure to wear off the dye.
4. Remove the valve from the cylinder head.
5. Inspect the valve face.
 - If the valve face is concentric, providing a proper seal, with the valve stem, a continuous mark (2) will be made around the entire face.

NOTE: The wear mark **MUST** be at least 0.5 mm (0.020 in) from the outer diameter, the margin (a), of the valve. If the wear mark is too close to the margin, the seat must be reconditioned to move the contact area away from the margin.

NOTE: Do not grind or condition the intake valve. If the intake valve is out of specification, replace the valve.

- If the face is not concentric with the stem, the mark will NOT be continuous around the valve face. The

valve should be refaced or replaced and the seat must be reconditioned using the Valve and Seat Reconditioning Procedure.

Valve and Seat Reconditioning Procedure

Fig. 430: Valve Seating Surface Angle
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- If the valve seat width, roundness or concentricity is beyond specifications, you must grind the seats in order to ensure proper heat dissipation and prevent the build up of carbon on the seats.
- It is necessary to reface the valve if seat reconditioning is required unless a new valve is used.

1. Grind the valve seating surface (a) to the proper angle specification (2). Refer to [Engine Mechanical Specifications](#).
2. Grind the valve relief surface to the proper angle specification (1) to correctly position the valve seating surface (a) to the valve. Refer to [Engine Mechanical Specifications](#).
3. Grind the valve undercut surface to the proper angle specification (3) to narrow the valve seating surface width (a). Refer to [Engine Mechanical Specifications](#).

NOTE:

Do not grind or condition the intake valve. If the intake valve seat has been

reconditioned, replace the corresponding intake valve.

4. Replace the intake valve if it is out of specification. Refer to [Engine Mechanical Specifications](#).
5. If the original exhaust valve is being used, grind the valve to the specifications listed in [Engine Mechanical Specifications](#). Measure the valve head O.D. and chamfer again after grinding using the Valve Head O.D. and Chamfer Measurement Procedure. Replace the exhaust valve if it is out of specification. New valves do not require grinding.
6. When grinding the valves and seats, grind off as little material as possible. Cutting valve seat results in lowering the valve spring pressure.
7. Install the valve in the cylinder head.
 - If you are using refaced exhaust valves, lap the valves into the seats with a fine grinding compound. The refacing and reseating operations should leave the refinished surfaces smooth and true so that minimal lapping is required. Excessive lapping will groove the valve face and prevent a good seat when hot.
 - Be sure to clean any remaining lapping compound from the valve and seat with solvent and compressed air prior to final assembly.
8. After obtaining the proper valve seat width in the cylinder head, you must re-measure the valve stem height using the Valve Stem Height Measurement Procedure.
9. If the valve stem height is acceptable, test the seats for concentricity using the Valve-to-Seat Concentricity Measurement Procedure.

Valve Stem Height Measurement Procedure

Fig. 431: Valve Stem Height Measurement
Courtesy of GENERAL MOTORS COMPANY

NOTE: To determine the valve stem height measurement, measure from the valve spring seat to the valve spring retainer.

1. Install the valve (1) into the valve guide in the cylinder head (2).
2. Ensure the valve is seated to the cylinder head valve seat.
3. Install the valve stem oil seal.
4. Install the valve spring retainer and valve stem locks.
5. Measure the distance (a) between the valve seal lip to the bottom of the valve spring retainer. Refer to [Engine Mechanical Specifications](#).
6. If the maximum height specification is exceeded, a new valve should be installed and the valve stem height re-measured.

CAUTION: DO NOT grind the valve stem tip. The tip of the valve is hardened and grinding the tip will eliminate the hardened surface causing premature wear and possible engine damage.

CAUTION: DO NOT use shims in order to adjust valve stem height. The use of shims will cause the valve spring to bottom out before the camshaft lobe is at peak lift and engine damage could result.

7. If the valve stem height still exceeds the maximum height specification, the cylinder head must be replaced.

CYLINDER HEAD ASSEMBLE

Special Tools

- **EN-8062** Valve Spring Compressor
- **EN-43963** Valve Spring Compressor - Off-Car Adapter
- **EN-46116** Valve Seal Remover
- **EN-46122** Camshaft Position Actuator Check-Ball Valve Remover/Installer

For equivalent regional tools, refer to [Special Tools](#).

Cylinder Head Assemble

1. Apply sealant to all plugs prior to installation. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Fig. 432: Cylinder Head Core Hole Plugs

Courtesy of GENERAL MOTORS COMPANY

CAUTION: Refer to [Component Fastener Tightening Caution](#) .

2. Install 2 NEW cylinder head core hole plugs (1) in the rear of the cylinder head. Tighten the plug to 25 N.m (18 lb ft).

Fig. 433: Side Cylinder Head Oil Gallery Plugs And Studs

Courtesy of GENERAL MOTORS COMPANY

3. Install 2 NEW cylinder head oil gallery plugs (1) in the side of the cylinder head.

CAUTION: Refer to [Torque-to-Yield Fastener Caution](#) .

4. Install 4 NEW catalytic converter studs (2). Tighten the studs to 10 N.m (89 lb in)

Fig. 434: Cylinder Head Core Hole Plugs, Oil Gallery Plugs And Oil Gallery Restrictor
Courtesy of GENERAL MOTORS COMPANY

5. Install 4 NEW cylinder head core hole plugs (1) in the top of the cylinder head. Tighten the plugs to 25 N.m (18 lb ft).
6. Install a NEW cylinder head oil restrictor (2).
7. Install 2 NEW cylinder head oil gallery plugs (3).
8. Install a NEW cylinder head core hole plug (4). Tighten the plug to 75 N.m (55 lb ft).

Fig. 435: Engine Oil Manifold Check Valve
Courtesy of GENERAL MOTORS COMPANY

9. If necessary, install new engine oil manifold check valves (3):
 1. Use lubricant included with **EN-46122** remover/installer to lubricate the outside of the new check valve (3).
 2. With the check ball end of the check valve facing **DOWN**, towards the head, insert the NEW check valve into the check valve bore in the cylinder head.
 3. Place **EN-46122-2** collar (2) over the new check valve with the slightly-larger inside diameter of the collar **DOWN** toward the cylinder head.
 4. Using the **EN-46122-1** driver (1), lightly tap the new check valve into place until the driver stops against

the top of the collar.

Intake and Exhaust Valve Components Installation

Fig. 436: Exhaust And Intake Valves

Courtesy of GENERAL MOTORS COMPANY

NOTE: Components **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts.

1. Ensure that the valve train components will be installed in their original position.
2. Lubricate the valve guides and the valve stems with engine oil.
3. Install the exhaust valves (1) and the intake valves (2) in the cylinder head.

Fig. 437: Valve Spring Retainer, Valve Spring And Oil Seal

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Valve stem oil seal sets will contain 2 different colored seals, black and green. The set of 8 seals that are green go on the exhaust valves.
- Ensure the valve stem oil seals do not deform during installation.

- Force should only be applied to the valve spring contact area of the new valve stem oil seal during installation.

4. Using **EN-46116** installer, carefully push the NEW valve stem oil seals (3) into position, until the seal positively locks on the guide.
5. Lubricate the valve stem and valve guide ID with clean engine oil. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
6. Install the valve spring (2) and the valve spring retainer (1).

Fig. 438: Special Tool To Remove/Install Valve Stem Keys
Courtesy of GENERAL MOTORS COMPANY

7. Using **EN-8062** compressor, position **EN-43963** adapter properly to the valve spring retainer.

WARNING: Compressed valve springs have high tension against the valve spring compressor. Valve springs that are not properly compressed by or released from the valve spring compressor can be ejected from the valve spring compressor with intense force. Use care when compressing or releasing the valve spring with the valve spring compressor and when removing or installing the valve stem keys. Failing to use care may cause personal injury.

CAUTION: Do not compress the valve springs less than 25.0 mm (0.984 in). Contact between the valve spring retainer and the valve stem oil seal can cause potential valve stem oil seal damage.

8. Using **EN-8062** compressor, compress the valve spring and scale the upper valve spring retainer down until the valve stem keys can be installed. Use a suitable tool and a bit of grease to install the valve stem keys (1).
9. Slowly release the tension on the valve spring.
10. Inspect for proper valve key seating.
11. Repeat the procedure for the remaining valves.

Fig. 439: Spark Plugs

Courtesy of GENERAL MOTORS COMPANY

12. Install the spark plugs (1) and tighten to 17 N.m (13 lb ft).

ENGINE BLOCK CLEANING AND INSPECTION

Special Tools

- **EN-8087** Cylinder Bore Gauge
- **EN-28410** Gasket Remover

For equivalent regional tools, refer to [Special Tools](#).

Cleaning Procedure

1. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to [Use of Room Temperature Vulcanizing \(RTV\) and Anaerobic Sealant](#)
2. Remove any old thread sealant, gasket material or sealant using **EN-28410** remover.
3. Clean all the following areas with solvent:
 - Sealing surfaces
 - Cooling passages

- Oil passages
- Bearing journals

4. Clean all threaded and through holes with solvent.

WARNING: Refer to [Safety Glasses Warning](#) .

5. Dry the engine block with compressed air.

Visual Inspection

Fig. 443: Block

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the crankshaft bearings journals for damage or spun bearings. The crankshaft bearing journals are not repairable, if the crankshaft bearing journals are damaged the cylinder block assembly must be replaced.
2. Inspect the primary camshaft drive chain tensioner mounting surface on the engine block for burrs or any defects that would degrade the sealing of the NEW primary camshaft drive chain tensioner gasket.
3. Inspect all sealing and mating surfaces for damage, repair or replace the cylinder block assembly if necessary.
4. Inspect all threaded and through holes for damage or excessive debris.
5. Inspect all bolts for damage, if damaged replace with NEW bolts only.
6. Check the cylinder condition. Some light vertical marks may be visible on the cylinder wall. In these areas, check that the honing marks are still visible in this marked area. If they are, the cylinder surface has not been

compromised and the engine block can be used.

7. Inspect the cylinder walls for cracks or damage. The cylinder sleeves are not serviced separately, if the cylinders are damaged the cylinder block assembly must be replaced.
8. Inspect the engine block for cracks. Do not repair any cracks. If cracks are found, the cylinder block assembly must be replaced.
9. Repair any damaged threaded holes. Refer to Thread Repair Specifications and Thread Repair.

Measuring Cylinder Bore Diameter

Fig. 444: Measuring Cylinder Bore

Courtesy of GENERAL MOTORS COMPANY

1. Measure the cylinder bore diameter 37 mm (1.457 in) from the deck face using the **EN-8087** gauge.
2. Compare your results with the [Engine Mechanical Specifications](#). If the cylinder diameter exceeds the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Measuring Cylinder Bore Taper

1. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centerline, at 10 mm (0.397 in) below the deck surface and record your measurement.
2. Measure the cylinder bore along the thrust surfaces, perpendicular to the crankshaft centerline, at 100 mm (3.976 in) below the deck surface and record your measurement.

3. Calculate the difference between the 2 measurements. The result will be the cylinder taper.
4. Compare your results with the [Engine Mechanical Specifications](#). If the cylinders exceed the specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Measuring Cylinder Bore Out-of-Round

1. Measure both the thrust and non-thrust cylinder diameter at 10 mm (0.397 in) below the deck. Record your measurements.
2. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the upper end of the cylinder.
3. Measure both the thrust and non-thrust cylinder diameter at 100 mm (3.976 in) below the deck surface. Record your measurements.
4. Calculate the difference between the 2 measurements. The result will indicate out-of-round at the lower end of the cylinder.
5. Compare your results with the [Engine Mechanical Specifications](#). If the cylinders exceed these specifications, the cylinder block may be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Deck Flatness Inspection

Fig. 445: Checking Deck Flatness
Courtesy of GENERAL MOTORS COMPANY

1. Ensure the engine block decks are clean and free of gasket material.
2. Inspect the surface for any imperfections or scratches that could inhibit proper cylinder head gasket sealing.
3. Place a straight-edge diagonally across the cylinder block deck face surface.
4. Measure the clearance between the straight-edge and the cylinder block deck face using a feeler gauge at 4 points along the straight-edge.
5. If the warpage is less than 0.05 mm (0.002 in), the cylinder block deck surface does not require resurfacing.
6. If the warpage is between 0.05 - 0.20 mm (0.002 - 0.008 in) or any imperfections or scratches that could inhibit proper cylinder head gasket sealing are present, the cylinder block deck surface requires resurfacing.
7. If resurfacing is required the maximum amount that can be removed is 0.25 mm (0.010 in).
8. If the cylinder block deck surface requires more than 0.25 mm (0.010 in) material removal the block must be replaced.

ENGINE BLOCK ASSEMBLE

Lower Crankcase Assemble

8	Starter Opening Cover
9	Starter Opening Cover Bolt (Qty: 2) Tighten 25 N.m (18 lb ft)

FUEL INJECTOR AND FUEL INJECTOR BORE CLEANING AND INSPECTION

Fig. 449: Fuel Injector and Fuel Injector Bore
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Use EN-47909 cleaning kit to clean the fuel injector bores. NOTE: Do not soak or immerse the fuel rail or injectors in solvent. 2. Clean the exterior of the fuel rail and injectors with solvent. Special Tools EN-47909 Injector Bore and Sleeve Cleaning Kit For equivalent regional tools, refer to Special Tools.	
1	Fuel Rail Assembly NOTE:

Callout	Component Name
	Do not remove the EN-51146 remover unless fuel injector replacement is necessary. Procedure 1. Inspect for damage, debris, or restrictions to the fuel rail and fuel ports. 2. Inspect for damage to the mounting area for the fuel rail. 3. Inspect for damage to the fuel rail mounting bolts. 4. Inspect for damage to the threads on the fuel rail fuel feed fitting. 5. Inspect the fuel rail pressure sensor for damage. 6. Inspect the fuel injector for damage to the harness connector. 7. Inspect the fuel injector tip, tolerance ring, and seal locations.
2	Fuel Injector Combustion Seal NOTE: Discard the seals and use NEW seals upon installation. Procedure 1. If present, remove the calibration tool on the fuel injector tip. 2. Remove and discard the fuel injector combustion seals. 3. Reinspect each fuel injector tip once the seals are removed.

PISTON AND CONNECTING ROD DISASSEMBLE

Fig. 450: Piston and Connecting Rod

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure NOTE: Many internal engine components will develop specific wear patterns on their friction surfaces. 1. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts. 2. Tag or mark each part immediately when removed. Indicate location, direction, or orientation when necessary.	

PISTON, CONNECTING ROD, AND BEARING CLEANING AND INSPECTION

Piston Cleaning Procedure

NOTE: DO NOT wire brush any part of the piston.

1. Clean the piston skirts and the pins with a cleaning solvent.
2. Clean the piston ring grooves with a groove cleaner. Ensure that the oil ring holes and slots are clean.

WARNING: Refer to [Safety Glasses Warning](#) .

3. Dry the piston with compressed air.

Piston Inspection Procedure

Fig. 451: Identifying Piston Inspection Areas

Courtesy of GENERAL MOTORS COMPANY

1. Inspect the pistons for the following conditions:
 - Cracked ring lands, skirts or pin bosses
 - Ring grooves for nicks, burrs that may cause binding (5)
 - Warped or worn ring lands (5)
 - Piston pin retainer grooves for burrs (2)

- Eroded areas at the top of the piston (1)
- Scuffed or damaged skirt coating (4)
- Worn piston pin bores or worn piston pins (3)

2. Replace pistons that show any signs of damage or excessive wear.

Piston Measurement Procedure

Fig. 452: Measuring Piston Width

Courtesy of GENERAL MOTORS COMPANY

1. Measure piston width using the following procedure:
 1. Using an outside micrometer, measure the width of the piston at 30 mm (1.181 in) below the crown, top, (1) at the thrust surfaces of the piston, perpendicular to the piston pin centerline.
 2. Compare the measurement of the piston to its original cylinder by subtracting the piston width from the cylinder diameter.
 3. Check your measurements. Refer to [Engine Mechanical Specifications](#).
 4. If the clearance obtained through measurement is greater than the provided specifications and the cylinder bores are within specification, replace the piston.

Fig. 453: Measuring Piston Pin Diameter

Courtesy of GENERAL MOTORS COMPANY

2. Measure the piston pin bore to piston pin clearances using the following procedure:
 1. Piston pin bores and pins must be free of varnish or scuffing.
 2. Use an outside micrometer to measure the piston pin in the piston contact areas.

Fig. 454: Measuring Piston Pin Bore
Courtesy of GENERAL MOTORS COMPANY

3. Using an inside micrometer, measure the piston pin bore. Compare your result with the piston pin diameter and piston pin to piston pin bore clearance specification. Refer to [Engine Mechanical Specifications](#).
4. If the clearance is excessive, determine which piece is out of specification and replace as necessary.
5. You must replace the piston if any of its dimensions are out of specification.
6. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only one size of oversized pistons and rings available for service.

Piston Ring Measurement Procedure

Fig. 455: Measuring Piston Ring End Gap

Courtesy of GENERAL MOTORS COMPANY

1. Measure the piston ring end gap using the following procedure:
 1. Place the piston ring in the area of the bore where the piston ring will travel approximately 25 mm (1 in) down from the deck surface. Ensure that the ring is square with the cylinder bore by positioning the ring with the piston head.
 2. Measure the end gap of the piston ring with feeler gauges. Refer to [Engine Mechanical Specifications](#).
 3. If the clearance exceeds the provided specifications, the piston rings must be replaced.
 4. Repeat the procedure for all the piston rings.

Fig. 456: Measuring Piston Ring Side Clearance
Courtesy of GENERAL MOTORS COMPANY

2. Measure the piston ring side clearance using the following procedure:
 1. Roll the piston ring entirely around the piston ring groove. If any binding is caused by the ring groove, dress the groove with a fine file. If any binding is caused by a distorted piston ring, replace the ring.
 2. With the piston ring on the piston, use feeler gauges to check clearance at multiple locations.
 3. Compare the measurements with piston ring side clearance specification. Refer to [Engine Mechanical Specifications](#).
 4. If the clearance is greater than specifications, replace the piston rings.

Fig. 457: Compression Ring Locating Dimple
Courtesy of GENERAL MOTORS COMPANY

3. There is a locating dimple (1) on the compression rings near the end for identification. Install the compression rings with the dimple facing up.
4. If the new ring does not reduce the clearance to the proper specification, install a new piston.
5. If the new piston does not meet clearance specifications, the cylinder block may need to be oversized to 0.25 mm (0.010 in). There is only 1 size of oversized pistons and rings available for service.

Connecting Rod Cleaning Procedure

1. Clean the connecting rods in solvent.

WARNING: Refer to [Safety Glasses Warning](#) .

2. Dry the connecting rod using compressed air.
3. Remove the connecting rod cap and clean the threads.
4. Remove the connecting rod bearing and discard. Never reuse a connecting rod bearing used in a running engine.

Connecting Rod Visual Inspection Procedure

Fig. 458: Inspecting Connecting Rod Components
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the piston pin bushing (4) for scoring or damage.
2. Inspect the connecting rod beam (1) for twisting or bending.
3. Inspect the rod cap (2) for any nicks or damage caused by possible interference.
4. Inspect for scratches or abrasion on the rod bearing seating surface.

NOTE: **DO NOT** scrape the rod or rod cap.

5. If the connecting rod bores contain minor scratches or abrasions, clean the bores in a circular direction with a light emery paper. Thoroughly clean the parts and perform a high-pressure wash if an abrasive is used on the bores.

Connecting Rod Measurement Procedure

Piston Pin End

Fig. 459: Measuring Piston Pin Diameter

Courtesy of GENERAL MOTORS COMPANY

NOTE: Measurements of all components should be taken with the components at normal room temperature.

1. Using an outside micrometer, take 2 measurements of the piston pin in the area of the connecting rod contact.

Fig. 460: Checking Connecting Rod Piston Pin Bore Dimensions
Courtesy of GENERAL MOTORS COMPANY

2. Using an inside micrometer, measure the connecting rod piston pin bore.
3. Subtract the piston pin diameter from the piston pin bore.
4. Compare the clearance measurements to the proper specifications. Refer to [Engine Mechanical Specifications](#).
5. If the clearance is excessive, replace the piston pin. If a new pin does not resolve the clearance problem, replace the connecting rod.

Connecting Rod Crankshaft Bearing End

Fig. 461: Measuring Connecting Rod Crankshaft Bearing Bore

Courtesy of GENERAL MOTORS COMPANY

NOTE: Measurements of all components should be taken with the components at normal room temperature.

NOTE: The bore specifications are based on connecting rod bolts at full torque specification.

1. Using the old bolts, tighten the connecting rod cap bolts to 25 N.m (18 lb ft) plus 75 degrees.
2. Using an inside micrometer, measure the connecting rod crankshaft bearing bore.
3. Compare the bore measurements to the proper specifications. Refer to [Engine Mechanical Specifications](#).
4. Replace the connecting rod if the bore is out of specifications. DO NOT recondition the connecting rod.

PISTON AND CONNECTING ROD ASSEMBLE

Fig. 462: Piston and Connecting Rod

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Connecting Rod NOTE: Align the connecting rod and piston with the features used to identify the orientation of the component relative to the front of the engine.

Callout	Component Name
2	Piston Procedure 1. Locate the alignment feature or marks on the connecting rod. 2. Locate the alignment feature or marks on the piston. 3. Ensure that the alignment features are in the correct location when assembling the components.
3	Piston Pin
4	Piston Pin Retainer CAUTION: Install the piston pin retainers correctly in the retaining groove during assembly in order to avoid engine damage. Procedure 1. Coat the piston pin with oil. 2. Install one side of one piston pin retainer into the retaining groove using EN-49941 installer. Rotate the retainer until it is fully seated in the groove. 3. Install the piston pin. Push the piston pin until it bottoms in the previously installed retainer. 4. Install the second piston pin retainer, using EN-49941 installer. 5. Ensure that the piston moves freely. Special Tools EN-49941 Piston Pin Retainer Remover and Installer For equivalent regional tools, refer to Special Tools .
5	Piston Oil Ring Rail CAUTION: Use a piston ring expander to install the piston rings. The rings may be damaged if

Callout	Component Name
	expanded more than necessary.
6	Piston Oil Ring Spacer NOTE: Properly orient the oil ring spacer as shown before installation. The ends of the spacer must be facing toward the top of the piston.
7	Piston Oil Ring Rail
8	Piston Compression Lower Ring
9	Piston Compression Upper Ring Procedure Once the rings are installed, set the ring gaps as shown. Use the piston location arrow for reference.

CAMSHAFT CLEANING AND INSPECTION

Special Tools

GE-7872 Magnetic Base Dial Indicator

For equivalent regional tools, refer to [Special Tools](#).

Cleaning Procedure

1. Clean the camshaft in solvent.

WARNING: Refer to [Safety Glasses Warning](#) .

2. Dry the camshaft with compressed air.

Visual Inspection

Fig. 463: Identifying Camshaft Inspection Areas
Courtesy of GENERAL MOTORS COMPANY

1. Inspect the camshaft oil feed holes (1) to the camshaft position actuator for dirt, debris or blockage.
2. Inspect the threaded hole (2) for damage.
3. Inspect the camshaft position actuator locating notch (3) for damage or wear.
4. Inspect the camshaft sealing grooves (4) for damage.
5. Inspect the camshaft thrust surface (5) for damage.
6. Inspect the camshaft lobes (6) and journals (7) for the following conditions:
 - Excessive scoring or pitting
 - Discoloration from overheating
 - Deformation from excessive wear, especially the camshaft lobes
7. If any of the above conditions exist on the camshaft, replace the camshaft.

Camshaft Measurement

Fig. 464: Supporting Camshaft In Fixture

Courtesy of GENERAL MOTORS COMPANY

1. With the camshaft in a suitable fixture, measure the camshaft for wear.

Fig. 465: Measuring Camshaft Journals

Courtesy of GENERAL MOTORS COMPANY

2. Measure the camshaft journals for diameter and out-of-round using an outside micrometer. Refer to [Engine Mechanical Specifications](#).
 - If the diameter is smaller than specifications, replace the camshaft.
 - If the out-of-round exceeds specifications, replace the camshaft.

Fig. 466: Checking Camshaft Runout

Courtesy of GENERAL MOTORS COMPANY

3. Measure the camshaft runout using the **GE-7872** indicator. Refer to [Engine Mechanical Specifications](#).

Fig. 467: Measuring Camshaft Thrust Width
Courtesy of GENERAL MOTORS COMPANY

4. Measure the camshaft thrust width for wear using a depth micrometer. Refer to [Engine Mechanical Specifications](#).

Fig. 468: Measuring Camshaft Thrust Wall Surface For Runout
Courtesy of GENERAL MOTORS COMPANY

5. Measure the camshaft thrust wall surface for runout using **GE-7872** indicator. Refer to [Engine Mechanical Specifications](#).
6. If the camshaft is damaged or worn beyond specifications, replace the camshaft. No machining of the camshaft is allowed.

Fig. 469: Measuring Camshaft Lobes For Wear
Courtesy of GENERAL MOTORS COMPANY

7. Measure the camshaft lobes for wear using the **GE-7872** indicator.

Fig. 470: Measuring Lift Of Camshaft Lobe
Courtesy of GENERAL MOTORS COMPANY

8. Place the **GE-7872** indicator with the indicator tip on the base circle (1) of the camshaft lobe.
 1. Place the **GE-7872** indicator at zero.
 2. Rotate the camshaft until the indicator tip is at the highest point (3) on the lobe. This reading is the lift of the camshaft lobe. Refer to [Engine Mechanical Specifications](#).
 3. If the indicated measurement is significantly lower than these specifications, replace the camshaft or engine performance will be reduced.

CAMSHAFT TIMING CHAIN AND SPROCKET CLEANING AND INSPECTION

Fig. 471: Camshaft Timing Chain and Sprocket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Timing Chain Procedure 1. Inspect the timing chain for binding or worn links. 2. Inspect the timing chain for loose links. 3. Inspect the timing chain for loose pins. 4. Replace the timing chain if binding, excessive wear, or a loose condition is present.
2	Timing Chain Guide Procedure 1. Inspect the guide for worn guide surface. Replace the timing chain guides if wear exceeds 1.12 mm (0.045 in) depth on the chain guide surface. 2. Inspect the guide for a cracked or broken guide surface. 3. Inspect the guide for a cracked or damaged guide base. 4. Replace the guide if damage is present.

Callout	Component Name
3	Camshaft Position Actuator Assembly - Exhaust Procedure 1. Inspect the camshaft actuator faces for signs of movement. 2. Inspect the camshaft actuator for sprocket damage. 3. Inspect the actuator bolt seating and sealing inner hub flange for damage. 4. Inspect the back of the actuator for locating pin damage. 5. Ensure the actuator housing bolts are not loose or missing. 6. Inspect the back of the actuator for blockage to the oil passages. 7. Replace the actuator if any of these conditions are present.
4	Timing Chain Guide Procedure 1. Inspect the guide for wear to the guide surface. 2. Inspect the guide for cracked or broken guide surface or base. 3. Replace the guide if these conditions are present.
5	Timing Chain Oil Nozzle Procedure 1. Inspect the oil nozzle body for collapse or cracks at the bolt boss. Discard and replace the oil nozzle body if it is damaged. 2. Verify oil nozzle oil flow with compressed air. 3. Replace the nozzle if damage or oil flow restriction is present.
6	Timing Chain Tensioner Shoe Procedure 1. Inspect for worn, cracked, or broken shoe surface. 2. Inspect the shoe for wear at the tensioner contact pad. 3. Replace the shoe if any of these conditions are present.
7	Timing Chain Tensioner Procedure 1. Inspect the tensioner for damage to the plunger-to-shoe contact surface. 2. Inspect the tensioner for a locked or binding condition. Reset the plunger and ensure the plunger moves freely in and out of the tensioner body. • If the tensioner has a lever on the front, press down on the lever and depress the plunger. Insert a suitable tool into the hole in the tensioner body to hold the plunger in the retracted position. • If the tensioner has a retaining clip, press the clip and depress the plunger. Insert a suitable tool into the hole in the tensioner body to hold the plunger in the retracted

Callout	Component Name
	position. 3. Inspect the timing chain tensioner gasket for damage. 4. Replace the tensioner if any of these conditions are present.
8	Camshaft Position Actuator Assembly - Intake Procedure 1. Inspect the camshaft actuator faces for signs of movement. 2. Inspect the camshaft actuator for sprocket damage. 3. Inspect the actuator bolt seating and sealing inner hub flange for damage. 4. Inspect the back of the actuator for locating pin damage. 5. Ensure the actuator housing bolts are not loose or missing. 6. Inspect the back of the actuator for blockage to the oil passages. 7. Replace the actuator if any of these conditions are present.

INTAKE MANIFOLD CLEANING AND INSPECTION

Fig. 472: Intake Manifold

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove all components prior to cleaning and inspection. 2. Inspect each component.	
1	Manifold Absolute Pressure Sensor Bolt CAUTION: Refer to Fastener Caution .

Callout	Component Name
	Tighten 10 N.m (89 lb in)
2	Manifold Absolute Pressure Sensor
3	Evaporative Emission Canister Purge Solenoid Valve Bolt Tighten 10 N.m (89 lb in)
4	Evaporative Emission Canister Purge Solenoid Valve
5	Upper Intake Manifold Cover Bolt (Qty: 3) Tighten 8 N.m (71 lb in)
6	Upper Intake Manifold Cover
7	Intake Manifold Cover Bolt (Qty: 3) Tighten 7 N.m (62 lb in)
8	Lower Intake Manifold Cover

CRANKSHAFT AND BEARING CLEANING AND INSPECTION

Special Tools

- **EN-8087** Cylinder Bore Checking Gauge
- **EN-45059** Angle Meter
- **GE-7872** Magnetic Base Dial Indicator Set

For equivalent regional tools, refer to [Special Tools](#).

Crankshaft Cleaning and Inspection

Fig. 473: Crankshaft

Courtesy of GENERAL MOTORS COMPANY

NOTE: Use care when handling the crankshaft. Avoid damage to the bearing surfaces or the lobes of the crankshaft position reluctor ring. Damage to the teeth of the crankshaft position reluctor ring may affect on-board diagnostic (OBD) II system performance.

1. Clean the crankshaft (1) with solvent.
2. Thoroughly clean all oil passages and inspect for restrictions or burrs.

WARNING: Refer to [Safety Glasses Warning](#) .

3. Dry the crankshaft with compressed air.

NOTE: Reluctor ring teeth should not have imperfections on the rising or falling edges. Imperfections of the reluctor ring teeth may effect OBD II system performance.

4. Perform a visual inspection of the crankshaft for damage.

Fig. 474: Identifying Different Crankshaft Journal Wear Patterns
Courtesy of GENERAL MOTORS COMPANY

5. Inspect the crankshaft journals for wear (1). The journals should be smooth, with no signs of scoring, wear, or damage.
6. Inspect the crankshaft journals for grooves or scoring (2).
7. Inspect the crankshaft journals for scratches or wear (3).
8. Inspect the crankshaft journals for pitting or imbedded bearing material (4).

Crankshaft Measurements

Fig. 475: Measure Crankshaft Journals For Out-Of-Round
Courtesy of GENERAL MOTORS COMPANY

1. Measure the crankshaft journals (1) for out-of-round.
2. Measure the crankshaft journals for taper.

Fig. 476: Measuring Crankshaft Runout
Courtesy of GENERAL MOTORS COMPANY

3. Measure the crankshaft runout.

Using wooden V-blocks, support the crankshaft on the front and rear journals.

4. Use the **GE-7872** indicator (1) in order to measure the crankshaft runout at the front and rear intermediate journals.
5. Use the **GE-7872** indicator in order to measure the runout of the crankshaft rear flange.
6. Replace the crankshaft if the measurements are not within specifications. Refer to [Engine Mechanical Specifications](#).

Crankshaft Bearings Cleaning and Inspection

Fig. 477: Identifying Crankshaft Bearing Damage

Courtesy of GENERAL MOTORS COMPANY

NOTE:

- Crankshaft bearings **MUST** be separated, marked, or organized in a way to ensure installation to their original location and position, when suitable for use.
- If crankshaft bearing failure is due to other than normal wear, investigate the cause. Inspect the crankshaft or connecting rod bearing bores.

1. Inspect crankshaft bearings for craters or pockets (1). Flattened sections on the bearing halves also indicate fatigue.
2. Inspect the crankshaft bearings for excessive scoring or discoloration (2).
3. Inspect the crankshaft bearings for dirt or debris imbedded into the bearing material.
4. Inspect the crankshaft bearings for improper seating indicated by bright, polished sections of the bearing (3).

If the lower half of the bearing is worn or damaged, both upper and lower halves should be replaced.

Generally, if the lower half is suitable for use, the upper half should also be suitable for use.

Fig. 478: Measuring Crankshaft Main Bearing Bores
Courtesy of GENERAL MOTORS COMPANY

5. Inspect the connecting rod bearing bores or crankshaft main bearing bores using the following procedure:
 1. Tighten the bedplate to specification using the **EN-45059** meter.
 2. Measure the bearing bore for taper and out-of-round using the **EN-8087** gauge (1).
 3. No taper or out-of-round should exist.

Bearing Selection

1. Measure the bearing clearance to determine the correct replacement bearing insert size. There are 2 methods to measure bearing clearance. Method A gives more reliable results and is preferred.
 - Method A yields measurement from which the bearing clearance can be computed.
 - Method B yields the bearing clearance directly. Method B does not give any indication of bearing run-out.

Fig. 479: Measuring Crankshaft Bearing Journal Using Method A
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not mix inserts of different nominal size in the same bearing bore.**

2. To measure bearing clearance using Method A, use the following procedure:
 1. Measure the crankshaft bearing journal diameter with a micrometer (1) in several places, 90 degrees apart. Average the measurements.
 2. Measure the crankshaft bearing journal taper and runout.
 3. Install the lower crankcase and tighten the bearing cap bolts to specification.
 4. Measure bearing inside diameter (ID) in several places 90 degrees apart, average measurements.
 5. Subtract journal measurement from bearing ID measurement to determine clearance.
 6. Determine whether clearance is within specification.
 7. If out of specification, choose different inserts.
 8. Measure the connecting rod inside diameter in the same direction as the length of the rod with an inside micrometer.
 9. Measure the crankshaft main bearing inside diameter with an inside micrometer.

Fig. 480: Measuring Bearing Clearance With Gaging Plastic Using Method B
Courtesy of GENERAL MOTORS COMPANY

3. To measure bearing clearance using Method B, use the following procedure:

1. Clean the used bearing inserts.
2. Install the used bearing inserts.
3. Place a piece of gaging plastic across the entire bearing width.
4. Install the bearing caps.

CAUTION: In order to prevent the possibility of cylinder block or crankshaft bearing cap damage, the crankshaft bearing caps are tapped into the cylinder block cavity using a brass, lead, or a leather mallet before the attaching bolts are installed. Do not use attaching bolts to pull the crankshaft bearing caps into the seats. Failure to use this process may damage a cylinder block or a bearing cap.

5. Install the bearing cap bolts to specification.

NOTE: Do not rotate the crankshaft.

6. Remove the bearing cap, leaving the gauging plastic in place. It does not matter whether the gauging plastic adheres to the journal or to the bearing cap.

- 7. Measure the gauging plastic at its widest point with the scale (1) printed on the gauging plastic package.
- 8. Remove the gauging plastic.

OIL PUMP DRIVE CHAIN TENSIONER AND OIL PUMP DRIVE CHAIN CLEANING AND INSPECTION

Fig. 481: Oil Pump Drive Chain Tensioner and Oil Pump Drive Chain Cleaning and Inspection
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
1. Clean all components.	
2. Inspect each component.	
1	Oil Pump Drive Chain
2	Oil Pump Drive Chain Tensioner Bolt
3	Oil Pump Drive Chain Tensioner

OIL PUMP CLEANING AND INSPECTION

Fig. 482: Oil Pump Cleaning and Inspection
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure	
1. Clean all components.	
2. Inspect each component.	
1	Oil Pump
2	Oil Pump Gasket
3	Oil Pump Gasket
4	Oil Pump Flow Control Solenoid Valve Retainer
5	Oil Pump Flow Control Solenoid Valve

OIL PAN CLEANING AND INSPECTION

Fig. 483: Oil Pan Cleaning and Inspection
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove all components prior to cleaning. 2. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant 3. Clean all components. 4. Inspect each component.	
1	Upper Oil Pan Locating Pin (Qty: 2)
2	Upper Oil Pan
3	Lower Oil Pan Locating Pin (Qty: 2)
4	Lower Oil Pan NOTE: Use a NEW lower oil pan.
5	Oil Pan Drain Plug

THREAD REPAIR

Special Tools

- EN 42385-307 Drill Bushing
- EN 42385-308 Alignment Pin

- EN 42385-510 Main Attachment Bolt
- EN 42385-900 Head Bolt Thread Repair Kit
- EN 42385-904 Thread Insert

For equivalent regional tools, refer to [Special Tools](#).

General Thread Repair

Fig. 484: Bushing Type Insert And Base Material
 Courtesy of GENERAL MOTORS COMPANY

The thread repair process involves a solid, thin walled, self-locking, carbon steel, bushing type insert (1). During the bushing installation process, the driver tool expands the bottom external threads of the insert into the base material (2). This action mechanically locks the insert in place. Also, when installed to the proper depth, the flange of the insert will be seated against the counterbore of the repaired hole.

Fig. 485: Drilling And Tapping Threads
Courtesy of GENERAL MOTORS COMPANY

NOTE: The use of a cutting fluid, WD 40® , or equivalent, is recommended when performing the drilling, counterboring, and tapping procedures. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Driver oil **MUST** be used on the installer driver tool.

The tool kits are designed for use with either a suitable tap wrench or drill motor.

1. Drill out the threads of the damaged hole (1).
 - M6 inserts require a minimum drill depth of 15 mm (0.59 in).
 - M8 inserts require a minimum drill depth of 20 mm (0.79 in).
 - M10 inserts require a minimum drill depth of 23.5 mm (0.93 in).

WARNING: Refer to [Safety Glasses and Compressed Air Warning](#) .

2. Using compressed air, clean out any chips.

Fig. 486: Identifying Tool Used To Counterbore Hole
Courtesy of GENERAL MOTORS COMPANY

3. Counterbore the hole to the full depth permitted by the tool (1).
4. Using compressed air, clean out any chips.

Fig. 487: Drilling And Tapping Threads

Courtesy of GENERAL MOTORS COMPANY

5. Using a tap wrench (2), tap the threads of the drilled hole.
- M6 inserts require a minimum tap depth of 15 mm (0.59 in).
 - M8 inserts require a minimum tap depth of 20 mm (0.79 in).
 - M10 inserts require a minimum tap depth of 23.5 mm (0.93 in).

WARNING: Refer to [Safety Glasses and Compressed Air Warning](#) .

WARNING: Refer to [Cleaning Solvent Warning](#) .

6. Using compressed air, clean out any chips.
7. Spray cleaner into the hole. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).
8. Using compressed air, clean any cutting oil and chips out of the hole.

Fig. 488: Lubricating Installer Tool Threads
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

9. Lubricate the threads of the installer tool (2) with the driver oil (1).

Fig. 489: Driver Tool And Insert

Courtesy of GENERAL MOTORS COMPANY

10. Install the insert (2) onto the driver tool (1).

Fig. 490: Applying Threadlock To Insert OD Threads
Courtesy of GENERAL MOTORS COMPANY

11. Apply threadlock LOCTITE™ 277, EN 42385 - 109 (1) loctite, or equivalent to the insert OD threads (2).

Fig. 491: Installing Insert Into Bolt Hole Using Installer Tool
Courtesy of GENERAL MOTORS COMPANY

12. Install the insert (2) into the hole.

Install the insert until the flange of the insert contacts the counterbored surface. Continue to rotate the installer tool (1) through the insert.

The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.

Fig. 492: Bushing Type Insert And Base Material
Courtesy of GENERAL MOTORS COMPANY

13. Inspect the insert for proper installation into the hole.

A properly installed insert (1) will be either flush or slightly below flush with the surface of the base material (2).

Cylinder Head Bolt Hole Thread Repair

Fig. 493: Cylinder Head Bolt Hole Thread Repair Kit
Courtesy of GENERAL MOTORS COMPANY

NOTE: The tools listed may not necessarily represent the exact tools used for the procedure.

1. The cylinder head bolt hole thread repair kit consists of the following items:
 - Drill (1)
 - Tap (2)

- Installer (3)
- Sleeve (4)
- Alignment Pin (5)
- Bushing (6)
- Bolts (7)
- Fixture Plate (8)

Fig. 494: Fixture Plate, Bolts And Bushing
 Courtesy of GENERAL MOTORS COMPANY

WARNING: Refer to [Safety Glasses and Compressed Air Warning](#) .

NOTE: The use of a cutting fluid, WD 40® , or equivalent, is recommended when performing the drilling and tapping procedures. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

Driver oil **MUST** be used on the installer driver tool.

The tool kits are designed for use with either a suitable tap wrench or drill motor.

2. Install the fixture plate (3), bolts (1), and bushing (2) onto the engine block deck.

Position the fixture plate and bushing over the hole that is to be repaired (4).

Fig. 495: Alignment Pin & Fixture Retaining Bolts
Courtesy of GENERAL MOTORS COMPANY

3. Position the alignment pin (1) through the bushing and into the hole.
4. With the alignment pin in the desired hole, tighten the fixture retaining bolts (2).
5. Remove the alignment pin from the hole.

Fig. 496: Installing Sleeve Onto Drill

Courtesy of GENERAL MOTORS COMPANY

6. Install the sleeve (2) onto the drill (1), if required.

Fig. 497: Drilling Out Threads Of Damaged Hole

Courtesy of GENERAL MOTORS COMPANY

NOTE: During the reaming process, it is necessary to repeatedly remove the drill and clean the chips from the hole.

7. Drill out the threads of the damaged hole.

Drill the hole until the stop collar of the drill bit or the sleeve contacts the bushing.

WARNING: Refer to [Safety Glasses and Compressed Air Warning](#) .

8. Using compressed air, clean out any chips.

Fig. 498: Tapping Threads Of Drilled Hole With Tap Wrench
Courtesy of GENERAL MOTORS COMPANY

9. Using a tap wrench, tap the threads of the drilled hole.

Fig. 499: Fixture Plate, Drill Bushing And Tool Marking
Courtesy of GENERAL MOTORS COMPANY

10. Using a TAP wrench, tap the threads of the drilled hole.

In order to tap the new threads to the proper depth, rotate the tap into the hole until the mark (3) on the tap align with the top of the drill bushing (2).

11. Remove the fixture plate (1), bushing (2), and bolts.

WARNING: Refer to [Safety Glasses and Compressed Air Warning](#) .

WARNING: Refer to [Cleaning Solvent Warning](#) .

12. Using compressed air, clean out any chips.

13. Spray cleaner into the hole. Refer to [Adhesives, Fluids, Lubricants, and Sealers](#).

14. Using compressed air, clean any cutting oil and chips out of the hole.

Fig. 500: Lubricating Installer Tool Threads
Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not allow oil or other foreign material to contact the outside diameter (OD) of the insert.

15. Lubricate the threads of the installer tool (2) with the driver oil (1).

Fig. 501: Driver Tool And Insert

Courtesy of GENERAL MOTORS COMPANY

16. Install the insert (2) onto the driver tool (1).

Fig. 502: Applying Threadlock To Insert OD Threads
Courtesy of GENERAL MOTORS COMPANY

17. Apply threadlock LOCTITE™ 277, EN 42385 - 109 loctite (1), or equivalent to the insert OD threads (2).

Fig. 503: Installing Insert And Driver Into Hole
Courtesy of GENERAL MOTORS COMPANY

18. Install the insert and driver (1) into the hole.

Rotate the driver tool until the mark on the tool aligns with the deck surface of the engine block.

The installer tool will tighten up before screwing completely through the insert. This is acceptable. You are forming the bottom threads of the insert and mechanically locking the insert to the base material threads.

SERVICE PRIOR TO ASSEMBLY

The importance of cleanliness during assembly cannot be overstated. Dirt or debris will cause engine damage. An automobile engine is a combination of many machined, honed, polished and lapped surfaces with tolerances that are measured in ten thousandths of an inch. When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly in order to protect and lubricate the surfaces on initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas are part of the repair procedure. This is considered standard shop practice even if not specifically stated.

Lubricate all moving parts with engine oil or a specified assembly lubricant. This will provide lubrication for initial start up.

CRANKSHAFT AND BEARING INSTALLATION

Fig. 504: Crankshaft and Bearing

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Upper Bearing (Qty: 4) NOTE: • Crankshaft bearings MUST be separated, marked, or organized in a way to ensure installation to their original location and position, when suitable for

Callout	Component Name
	use. • For vehicles equipped with Start/Stop and Hybrid vehicles, the #1 upper bearing is specifically coated for durability and has a blue coloration. Procedure Ensure that the guide lug on the bearing is properly seated to the notch in the engine block for each bearing. Coat the crankshaft bearing shell with engine oil.
2	Crankshaft Thrust Bearing Procedure Ensure that the guide lug on the bearing is properly seated to the notch in the engine block. Coat the crankshaft bearing shell with engine oil.
3	Crankshaft

LOWER CRANKCASE INSTALLATION

Fig. 505: Lower Crankcase With Bolt Tightening Sequences
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Lower Bearing (Qty: 5) Procedure Install the bearings in the lower crankcase, and ensure that the guide lug on the bearing is properly seated to the notch in the lower crankcase for each bearing. Coat the crankshaft bearing shell with engine oil.
2	Lower Crankcase Procedure 1. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant NOTE: The block assembly surface must be free of contamination prior to

Callout	Component Name
	applying the sealer. • Install and align the bedplate to block within 20 minutes of applying the sealer. • The bedplate must be fastened to final torque specification within 60 minutes of applying the sealer. 2. Apply a 3 mm bead of sealer directly in the groove of the block to bedplate mating surfaces. Refer to Adhesives, Fluids, Lubricants, and Sealers. 3. Install the lower crankcase, ensure the lower crankcase is aligned properly on the dowels. Tap gently into place with a suitable tool, if necessary.
3	Lower Crankcase Bolts (Qty: 10) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure Tighten the NEW lower crankcase bolts in the sequence shown. 1. Tighten the bolts in sequence a first pass to 15 N.m (11 lb ft). 2. Using the EN 45059 angle meter, tighten the bolts in sequence a final pass to 180 degrees. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

Callout	Component Name
4	Lower Crankcase Bolts (Qty: 13) Procedure 1. Apply sealant to the lower crankcase perimeter bolts. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Tighten the lower crankcase bolts in the sequence shown. 3. Tighten the bolts in sequence a first pass to 5 N.m (44 lb in). 4. Tighten the bolts in sequence a final pass to 10 N.m (89 lb in).

PISTON, CONNECTING ROD, AND BEARING INSTALLATION

Fig. 506: Piston, Connecting Rod and Bearing
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure NOTE: Many internal engine	

Callout	Component Name
	components will develop specific wear patterns on their friction surfaces. 1. Components MUST be separated, marked, or organized in a way to ensure installation to their original location and position. Take precautions in order to prevent interchanging of parts. 2. Ensure all components are adequately marked with location, direction, or orientation when necessary.
1	Connecting Rod Bearing (Qty: 4) NOTE: The connecting rod bearing anti-rotation tab grooves are to point toward the right-hand side of the engine. Procedure Install NEW bearings to the connecting rods and lubricate each bearing with engine oil.
2	Piston and Connecting Rod Assembly (Qty: 4) NOTE: The connecting rods and caps must be installed in the same order and orientation in which they were removed. If new connecting rods are required, the connecting rod is provided as an assembly,

Callout	Component Name
	and the upper rod will need to be disassembled from the lower cap. Procedure 1. Install the EN-51454 guides into the connecting rod bolt holes. This protects the crankshaft journal during piston and connecting rod installation. NOTE: Ensure to stagger each piston ring end gap equally around the piston. NOTE: When installing a piston into a cylinder, use a ring compressor sleeve or equivalent for best results. The following features should be looked for when selecting a ring compressor sleeve: • Hard anodized and Teflon coated for low friction and prolonged wear resistance. • Smooth radius that tapers down to the specific bore size.

Callout	Component Name
	• Sleeve should compress the piston rings smoothly and evenly. • Using a ring compressor sleeve greatly reduces the difficulty with installing thin high-performance oil rings. If a ring compressor sleeve is unavailable, a universal ring compressor will work, but is more difficult to use. 2. Install the ring compressor on the piston. 3. Ensure each piston ring end gap is spaced equally around the piston as shown. 4. Lubricate the piston and the piston rings with engine oil. Do not disturb the piston ring end gap location. 5. Lubricate the correct engine bore for the piston. NOTE: The piston must be installed oriented correctly to the front of the engine. 6. Position the piston so that the arrow mark on the top of the piston points to the front of the engine. 7. Install the ring compressor, the piston, and the connecting rod to the correct bore. 8. Tap the piston into the bore with a hammer handle. Guide the connecting rod to the connecting rod journal while tapping the piston into place. 9. Hold the ring compressor against the engine block until all the rings have entered the cylinder bore.

Callout	Component Name
	10. Remove the connecting rod guides from the connecting rod bolt holes. Special Tools EN-51454 Connecting Rod Guides For equivalent regional tools, refer to Special Tools.
3	Connecting Rod Bearing (Qty: 4) Procedure Install NEW bearings to the connecting rod caps and lubricate each bearing with engine oil.
4	Connecting Rod Cap (Qty: 4) Procedure Ensure that the connecting rod cap is properly oriented on the connecting rod.
5	Connecting Rod Bolts (Qty: 8) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure 1. Install NEW connecting rod bolts and tighten using the EN 45059 angle meter. 1. Tighten the bolts a first pass to 25 N.m (18 lb ft). 2. Tighten the bolts a final pass 75 degrees using EN 45059 angle meter. NOTE: Rotate the crankshaft to ensure that it moves freely and does not bind. 2. Measure the connecting rod side clearance with a feeler gauge. Refer to Engine Mechanical Specifications. 3. Measure the piston deck height. Refer to Engine Mechanical Specifications. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

CRANKSHAFT OIL DEFLECTOR INSTALLATION

Fig. 507: Crankshaft Oil Deflector (With Bolt Tightening Sequence)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Oil Deflector
2	Crankshaft Oil Deflector Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . Procedure Tighten the bolts in the sequence shown. Tighten 10 N.m (89 lb in)
3	Positive Crankcase Ventilation Oil Separator Drain Pipe
4	Positive Crankcase Ventilation Oil Separator Drain Pipe Bolt Tighten 10 N.m (89 lb in)

CRANKSHAFT REAR OIL SEAL INSTALLATION

Fig. 508: Crankshaft Rear Oil Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Rear Oil Seal Procedure 1. Inspect the seal recess for excess sealer material at the lower crankcase to engine block mating location. Remove excess sealer, if present. 2. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant 3. Add RTV sealer at 2 locations where the bedplate and block join prior to installing the oil seal. Refer to Adhesives, Fluids, Lubricants, and Sealers. NOTE: The oil seal must be installed in the correct direction.

Callout	Component Name
	The side that faces out will have "this side out" printed on it. Depending on seal design, the way the seal is installed on the EN-51369 installer is opposite. Either the seal is installed over the back of the installer, or the seal is installed over the front of the installer. Match the seal design as shown above and install the seal onto the installer in the correct direction. 4. Install the oil seal in the correct direction on EN-51369 seal installer. NOTE: If the seal is improperly installed on the special tool, it will not install correctly. 5. Inspect the seal on EN-51369 seal installer, and ensure that the seal lip is not deformed. If necessary, remove the seal and reinstall on the special tool. 6. Assemble the EN-51369 seal installer components.

Callout	Component Name
	NOTE: The special tool installs and establishes the proper depth of the seal in the crankshaft seal bore. 7. Use EN-51369 seal installer to press the new crankshaft seal into the housing. Ensure that the seal is installed in the crankshaft seal bore flush to 0.5 mm depth. Special Tools EN-51369 Seal Installer For equivalent regional tools, refer to Special Tools.

OIL PUMP DRIVE CHAIN AND OIL PUMP INSTALLATION

Oil Pump Assembly Installation

2	Oil Pump Gasket
3	Oil Pump Assembly

Callout	Component Name
4	Oil Pump Assembly Bolt (Qty: 4) NOTE: Install the oil pump assembly and bolts loosely onto the engine block. Final torque must be performed after the drive chain is installed.
5	Oil Pump Flow Control Solenoid Valve
6	Oil Pump Flow Control Solenoid Valve Retainer

Crankshaft Sprocket and Oil Pump Drive Chain Installation

Fig. 510: Crankshaft Sprocket and Oil Pump Drive Chain

Crankshaft Sprocket and Oil Pump Drive Chain Installation

Callout	Component Name
1	Crankshaft Sprocket
2	Crankshaft Balancer Key
3	Oil Pump Drive Chain CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Procedure 1. Tilt the oil pump assembly in order to install the drive chain over the oil pump and crankshaft sprockets. 2. Once the drive chain is correctly positioned on the sprockets, tighten the oil pump assembly bolts to 10 N.m (89 lb in).
4	Oil Pump Drive Chain Tensioner Assembly NOTE: Ensure the tensioner spring is retained in the correct position prior to installation.
5	Oil Pump Drive Chain Tensioner Bolt Tighten 10 N.m (89 lb in)
6	Oil Pump Assembly Bolt Tighten 10 N.m (89 lb in)

CYLINDER HEAD INSTALLATION

Fig. 511: Cylinder Head With Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Cylinder Head Gasket NOTE: Ensure that the cylinder head and the engine block sealing surfaces are clear of oil, grease, and old gasket material.
2	Cylinder Head Assembly
3	Cylinder Head Bolt (Qty: 10) CAUTION:

Callout	Component Name
	Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure Tighten the NEW cylinder head bolts in the sequence shown. 1. Tighten the bolts a first pass to 30 N.m (22 lb ft). 2. Using the EN-45059 angle meter, tighten the bolts a final pass to 240 degrees. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

INTAKE AND EXHAUST CAMSHAFT, BEARING CAP, AND LASH ADJUSTER INSTALLATION

Valve Rocker Arm and Lash Adjuster Installation

Fig. 512: Valve Rocker Arm and Lash Adjuster
 Courtesy of GENERAL MOTORS COMPANY

Valve Rocker Arm and Lash Adjuster Installation

Callout	Component Name
1	Hydraulic Valve Lash Adjuster Assembly Procedure Install the lash adjusters in the bores in the cylinder head. Apply lubricant to the lash adjusters, refer to Adhesives, Fluids, Lubricants, and Sealers .
2	Hydraulic Valve Lash Adjuster Arm Assembly NOTE: Used lash adjuster arms must be returned to the original position on the camshaft. If the camshaft is being

Callout	Component Name
	replaced, the lash adjuster arms actuated by the camshaft must also be replaced. Procedure 1. Apply lubricant to the valve tips, refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Position the lash adjuster arm on the tip of the valve stem and on the lash adjuster. 3. Apply lubricant to the lash adjuster arms, refer to Adhesives, Fluids, Lubricants, and Sealers.

Camshaft Bearings and Camshaft Installation

Fig. 513: Camshaft Bearings and Camshaft
Courtesy of GENERAL MOTORS COMPANY

Camshaft Bearings and Camshaft Installation

Callout	Component Name
1	Exhaust Camshaft Assembly Procedure 1. Coat the exhaust camshaft with lubricant. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Install the exhaust camshaft in the cylinder head. 3. Ensure that the camshaft notch at the front of the camshaft is in the 12 o'clock position. 4. Rotate the oil seal in the groove of the number one camshaft journal so the split line is at approximately the 12 o'clock position before installing the camshaft caps.
2	Camshaft Bearing Cap - Exhaust Side (Qty: 5) NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. Ensure the caps are installed in the original location and position. Procedure Install the cap and start the cap bolts by hand.
3	Camshaft Bearing Front Exhaust Cap Procedure Install the cap and start the cap bolts by hand.
4	Camshaft Bearing Cap Bolt - Exhaust Side (Qty: 12) CAUTION: Refer to Fastener Caution. Procedure 1. Lubricate the cap bolts. 2. Tighten the bearing cap bolts in sequence three turns each until the caps are seated. Tighten 12 N.m (106 lb in)

Callout	Component Name
5	Intake Camshaft Assembly Procedure 1. Coat the intake camshaft with lubricant. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Install the intake camshaft in the cylinder head. 3. Ensure that the camshaft notch at the front of the camshaft is in the 12 o'clock position. 4. Rotate the oil seal in the groove of the number one camshaft journal so the split line is at approximately the 12 o'clock position before installing the camshaft caps.
6	Camshaft Bearing Cap - Intake Side (Qty: 4) NOTE: Observe the markings on the bearing caps. Each bearing cap is marked in order to identify its location. Ensure the caps are installed in the original location and position. Procedure Install the cap and start the cap bolts by hand.
7	Camshaft Bearing Rear Cap - Intake Side Procedure Install the cap and start the cap bolts by hand.
8	Camshaft Bearing Front Intake Cap Procedure Install the cap and start the cap bolts by hand.
9	Camshaft Bearing Cap Bolt - Intake Side (Qty: 12) Procedure 1. Lubricate the cap bolts. 2. Tighten the bearing cap bolts in sequence three turns each until the caps are seated. Tighten 12 N.m (106 lb in)

Camshaft Actuator Installation

Fig. 514: Camshaft Actuator

Courtesy of GENERAL MOTORS COMPANY

Camshaft Actuator Installation

Callout	Component Name
Preliminary Procedure Install the EN-51367 camshaft locking tool. Remove when the camshaft actuator bolts are tightened to specification.	
Special Tools EN-51367 Camshaft Locking Tool For equivalent regional tools, refer to Special Tools .	
1	Camshaft Position Actuator - Intake NOTE: Align the actuator with the notch in the camshaft.
2	Camshaft Position Actuator Bolt CAUTION:

Callout	Component Name
	Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure Tighten the NEW camshaft position actuator bolt in the sequence shown. 1. Tighten the bolt a first pass to 20 N.m (15 lb ft). 2. Using the EN 45059 angle meter, tighten the bolt a final pass to 90 degrees. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.
3	Camshaft Position Actuator - Exhaust NOTE: Align the actuator with the notch in the camshaft.
4	Camshaft Position Actuator Bolt Procedure Tighten the NEW camshaft position actuator bolt in the sequence shown. 1. Tighten the bolt a first pass to 20 N.m (15 lb ft). 2. Using the EN-45059 angle meter, tighten the bolt a final pass to 90 degrees. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

CAMSHAFT TIMING CHAIN INSTALLATION

Fig. 515: Camshaft Timing Chain Components
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Timing Chain Oil Nozzle CAUTION: Refer to Component Fastener Tightening Caution . Tighten 15 N.m (11 lb ft)
2	Timing Chain NOTE: Ensure the actuator timing marks and the

Callout	Component Name
	crankshaft sprocket keyway are at the 12 O'Clock position. Procedure NOTE: Ensure the correct timing link is aligned with the timing mark. The color of the actuator timing links are the same, and the color of the crankshaft sprocket timing link is unique. 1. Align the first timing chain link with the intake actuator timing mark. 2. Align the second timing chain link with the exhaust actuator timing mark. 3. Align the final timing chain link with the crankshaft sprocket timing mark.
3	Timing Chain Guide - Exhaust Side
4	Timing Chain Guide Bolt (Qty: 3) CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)
5	Timing Chain Tensioner Shoe Assembly
6	Timing Chain Tensioner Shoe Bolt Tighten 25 N.m (18 lb ft)
7	Timing Chain Tensioner Gasket

Callout	Component Name
8	Timing Chain Tensioner Assembly NOTE: Ensure the tensioner is fully retracted prior to installation. Depending on tensioner model, the procedure to depress and lock the plunger is different. Procedure 1. If the tensioner has a lever on the front, press down on the lever and depress the plunger. Insert a suitable tool into the hole in the tensioner body to hold the plunger in the retracted position. 2. If the tensioner has a retaining clip, press the clip and depress the plunger. Insert a suitable tool into the hole in the tensioner body to hold the plunger in the retracted position.
9	Timing Chain Tensioner Bolt (Qty: 2) Tighten 25 N.m (18 lb ft)
10	Timing Chain Upper Guide - to Cylinder Head
11	Timing Chain Upper Guide Bolt (Qty: 2) Tighten 10 N.m (89 lb in)

ENGINE FRONT COVER INSTALLATION

Engine Front Cover and Components Installation

Fig. 516: Engine Front Cover and Components With Bolt Tightening Sequence

Courtesy of GENERAL MOTORS COMPANY

Engine Front Cover and Components Installation

Callout	Component Name
1	Engine Front Cover Hole Plug CAUTION: Refer to Fastener Caution . Tighten 50 N.m (37 lb ft)
2	Engine Front Cover Procedure 1. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant NOTE:

Callout	Component Name
	• The engine front cover surface must be free of contamination prior to applying the sealer. • Install and align the cover within 20 minutes of applying the sealer. • The cover must be fastened to final torque specification within 20 minutes of applying the sealer. • Additional sealant is necessary to reduce the possibility of leakage where the cylinder head to engine block interface along the bead path flange on the front cover. 2. Apply a 4 mm bead of sealer directly in the flange of the engine front cover perimeter mating surface. 3. Apply a 3 mm bead of sealer circling 3 locations on the interior of the engine front cover. 4. Apply a 3 mm bead of sealant at the 2 horizontal groove locations along the flange where the cylinder head and engine block mate. Refer to Adhesives, Fluids, Lubricants, and Sealers.
3	Engine Front Cover Bolt - M6 (Qty: 11) NOTE:

Callout	Component Name
	Hand start the engine front cover bolts. Torque to specification when all front cover bolts and the stud are installed hand-tight. Tighten 15 N.m (11 lb ft)
4	Engine Front Cover Stud (Qty: 1) Tighten 15 N.m (11 lb ft)
5	Engine Front Cover Bolt - M6 (Qty: 1) NOTE: This interior M6 bolt is longer than the perimeter M6 bolts. Tighten 15 N.m (11 lb ft)
6	Engine Front Cover Bolt - M14 (Qty: 1) Tighten 58 N.m (43 lb ft) Procedure Tighten all the engine front cover bolts in the sequence shown. 1. Tighten the bolts a first pass to 5 N.m (44 lb in). 2. Tighten the bolts a final pass to final torque specification.

Crankshaft Front Oil Seal Installation

Fig. 517: Crankshaft Front Oil Seal

Courtesy of GENERAL MOTORS COMPANY

Crankshaft Front Oil Seal Installation

Callout	Component Name
1	Crankshaft Front Oil Seal Procedure NOTE: The oil seal must be installed in the correct direction. The side that faces out will have "this side out" printed on it. The design of the seal determines which end of the EN 51368 installer is used. Use the end of the installer that matches

Callout	Component Name
	the design of the seal, as shown. 1. Lubricate the outside diameter of the new crankshaft seal with clean engine oil. 2. Determine which end of the EN-51368 installer will be used and install the seal on it. 3. Install the EN-51368 installer over the crankshaft. 4. Install the EN-51368 screw, large washer, bearing, and nut. 5. Counter-hold the screw, and tighten the nut to install the seal. Special Tools EN-51368 Front Crankshaft Seal Installer For equivalent regional tools, refer to Special Tools.

OIL PAN INSTALLATION

Fig. 518: Oil Pan With Bolt Tightening Sequences
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
---------	----------------

Callout	Component Name
1	Engine Oil Level Indicator Control Wiring Harness
2	Wiring Harness Connector Bolt CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)
3	Upper Oil Pan Assembly Procedure 1. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant NOTE: • The lower crankcase and oil pan mating surfaces must be free of contamination prior to applying the sealer. • Install and align the oil pan to block within 20 minutes of applying the sealer. • The oil pan must be fastened to final torque specification within 60 minutes of applying the sealer. • Additional sealant is necessary to reduce the possibility of

Callout	Component Name
	leakage where the cylinder head to engine block interface along the bead path flange on the front cover. 2. Apply a 3 mm bead of sealer around the perimeter of the oil pan. Refer to Adhesives, Fluids, Lubricants, and Sealers. 3. Install the oil pan on the lower crankcase, ensure the oil pan locating pins align with the lower crankcase.
4	Oil Pan Bolt (Qty: 12) Procedure 1. Apply sealant to the oil pan bolts. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Hand start the oil pan bolts. Torque to specification when all oil pan bolts are installed hand-tight. Tighten 10 N.m (89 lb in)
5	Oil Pan Bolt (Qty: 2) Procedure 1. Apply sealant to the oil pan bolts. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Hand start the oil pan bolts. Torque to specification when all oil pan bolts are installed hand-tight. Tighten 10 N.m (89 lb in)
6	Oil Pan Bolt (Qty: 2) Procedure 1. Apply sealant to the oil pan bolts. Refer to Adhesives, Fluids, Lubricants, and Sealers. 2. Tighten all the oil pan bolts in sequence. 3. Inspect for excessive sealer around the oil filter mounting area when final torque is achieved. If extra sealer is present, remove and clean accordingly. Tighten 10 N.m (89 lb in)

Callout	Component Name
7	Lower Oil Pan Procedure 1. Connect the oil pump control valve wiring harness connector. 2. Use a NEW lower oil pan. 3. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant 4. Apply a 5 mm bead of sealer around the perimeter of the lower oil pan. Refer to Adhesives, Fluids, Lubricants, and Sealers. 5. Install the lower oil pan on the upper oil pan, ensure the oil pan locating pins align with the lower oil pan.
8	Lower Oil Pan Bolt (Qty: 12) Procedure Tighten the oil pan bolts in sequence. Tighten 10 N.m (89 lb in)

CAMSHAFT COVER INSTALLATION

Camshaft Cover Components Installation - Bottom

Fig. 519: Camshaft Cover Components - Bottom

Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover Components Installation - Bottom

Callout	Component Name
1	Camshaft Position Actuator Solenoid Valve

Callout	Component Name
2	Camshaft Position Actuator Solenoid Valve Bolt CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 10 N.m (89 lb in)
3	Camshaft Cover Locating Pin (Qty: 2)
4	Intake Camshaft Position Sensor
5	Camshaft Position Sensor Bolt Tighten 10 N.m (89 lb in)

Camshaft Cover Components Installation - Top

Fig. 520: Camshaft Cover Components - Top
Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover Components Installation - Top

Callout	Component Name
1	Exhaust Camshaft Position Sensor
2	Camshaft Position Sensor Bolt CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)
3	Camshaft Position Actuator Solenoid Valve
4	Camshaft Position Actuator Solenoid Valve Bolt Tighten 10 N.m (89 lb in)
5	Positive Crankcase Ventilation Tube with Positive Crankcase Ventilation Valve - Fresh Air NOTE: These components have tamper-proof connections and cannot be disassembled. The fresh air inlet duct is connected to the PCV Tube with a tamper-proof connection. All components must be replaced once removed. Procedure 1. Assemble a NEW PCV tube with NEW PCV valves and a NEW fresh air inlet duct. 2. Install the PCV valves to the camshaft cover.

Callout	Component Name
6	Positive Crankcase Ventilation Valve Bolt (Qty: 2) NOTE: Bolts are tamper-proof. Procedure Using EN-50956 bit, install NEW bolts. Tighten 10 N.m (89 lb in) Special Tools EN-50956 Tamper-Proof Drive Bit Equivalent regional tools: Special Tools

Camshaft Cover Installation

Fig. 521: Camshaft Cover With Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Camshaft Cover Installation

Callout	Component Name
1	Camshaft Cover Gasket NOTE: Use a NEW gasket. Procedure Assemble the camshaft cover and a NEW gasket. Ensure that the gasket is located in the retaining groove in the camshaft cover.
2	Camshaft Cover Procedure 1. Ensure proper use of room temperature vulcanizing (RTV) sealant. Refer to Use of Room Temperature Vulcanizing (RTV) and Anaerobic Sealant 2. Apply approximately a 5 mm (0.2 in) thick bead of camshaft cover sealant on both sides between the cylinder head and the engine front cover. Refer to Adhesives, Fluids, Lubricants, and Sealers.
3	Camshaft Cover Bolt (Qty: 18) Procedure: Tighten the engine front cover bolts and studs in sequence.
4	Camshaft Cover Stud (Qty: 2) CAUTION: Refer to Fastener Caution . Procedure: Tighten the engine front cover bolts and studs in sequence. Tighten 15 N.m (11 lb ft)
5	Oil Level Indicator

FUEL RAIL AND INJECTORS INSTALLATION

Special Tools

- EN-49245 Fuel Injector Seal Installer/Sizer
- EN-51105 Injector Seal Installer Adapters
- EN-51146 Fuel Injector Removal/Installation Kit
- EN-51146-100 Fuel Injector Removal Plate
- EN-51146-150 Fuel Injector Removal Adapters

For equivalent regional tools, refer to [Special Tools](#).

Fuel Injector Installation Procedure

Fig. 522: Installing Fuel Injectors Using Removal/Installation Kit
 Courtesy of GENERAL MOTORS COMPANY

NOTE: Do not remove the fuel injectors unless inspection indicates replacement is necessary. Do not remove the EN-51146-150 adapter and EN-51146-1-1 support unless the fuel injector is being replaced.

1. If one or more fuel injectors are being replaced, remove the EN-51146-100 plate (2) and bolts (1).
2. Remove the EN-51146-150 adapters and EN-51146-1-1 supports (3) for all fuel injectors that are being replaced.
3. Remove and discard the fuel injectors (5) that are being replaced.
4. Lubricate the O-ring with one drop of clean engine oil. Install a new fuel injector (5).

CAUTION: Refer to [Fastener Caution](#) .

5. Install the NEW fuel injector screws (4) to the NEW fuel injectors (5) and tighten to 5 N.m (44 lb in).
6. Connect the fuel injector wiring harness plugs.

Fuel Injector Combustion Seal Installation Procedure

Fig. 523: Installing Combustion Seals

Courtesy of GENERAL MOTORS COMPANY

NOTE: DO NOT use any type of lubricant when installing the NEW combustion seals on the fuel injector tip.

NOTE: The injector tip protectors in the EN-49245 set are too small for some injectors. Ensure EN-51105 is used on injector tips during seal installation. The pusher and final sizer work for all injectors.

1. Install **EN-51105-1** long protector (1) onto the fuel injector tip, covering the first recessed area closest to the tip. Place a NEW seal (2) on **EN-51105-1** long protector (1).
2. Using **EN-49245-3** pusher (3), install the seal (2) into the recessed area of the fuel injector.
3. Compress the seal (2) with your fingers.
4. Install **EN-51105-2** short protector (4) onto the fuel injector tip. Place a NEW seal (5) on **EN-51105-2** short protector (4).
5. Using **EN-49245-3** pusher (3), install the seal (5) into the last recessed area of the fuel injector.
6. Compress the seal (5) with your fingers.

Fig. 524: Pre-Sizing Tool

Courtesy of GENERAL MOTORS COMPANY

7. Push the **EN-51146-2-4** pre-sizing tool (1) over the fuel injector tip.
8. Tighten the nut (2) and counterhold at the spanner flat (3) of the **EN-51146-2-4** pre-sizing tool (1) until the measure (a) of 4.5 mm (0.177 in) is reached.
9. Loosen the nut (2) of the **EN-51146-2-4** pre-sizing tool.
10. Install the **EN-51146-2-4-7** take off chassis (4) to the **EN-51146-2-4** pre-sizing tool (1).
11. Install the **EN-51146-2-4-6** screw M10 (5) to the **EN-51146-2-4-7** take off chassis (4) and tighten until the **EN-51146-2-4** pre-sizing tool (1) is loosened.

Fig. 525: Sizer

Courtesy of GENERAL MOTORS COMPANY

12. Install the **EN-49245-4** sizer (1) in a rotary motion to the fuel injector tip in order to complete the combustion seal final sizing.

Fig. 526: Ensure Seals Are Installed Correctly

Courtesy of GENERAL MOTORS COMPANY

NOTE: The fuel injector seals must fit properly in the relative groove. Overlapping of the fuel injector seals with the external surface of the injector must be avoided.

13. Check both of the fuel injector combustion seals on each fuel injector for correct seat:

- The seal must not be too large, buckled, or corrugated (1)
- The seal must be fixed tight and accurate (2)

14. If the seals are not installed correctly, remove the incorrect seal and replace with a NEW seal.

Fuel Rail Assembly Installation Procedure

Fig. 527: Installing Fuel Rail Assembly Using Special Tools

Courtesy of GENERAL MOTORS COMPANY

1. If any components of EN-51146 remover are installed to the fuel rail, perform the following procedure:

NOTE: If the plate is not installed on the supports, it is likely one or more fuel injectors have been replaced. Disregard the following steps for fuel injectors that have already been replaced.

1. Remove the bolts (1) and EN-51146-100 plate (2).
2. Remove only the front EN-51146-150 adapter and EN-51146-1-1 support (3) for the first fuel injector.

CAUTION: Refer to [Fastener Caution](#) .

3. Install the fuel injector screw (4) and tighten to 5 N.m (44 lb in).
 4. Remove the rear **EN-51146-150** adapter and **EN-51146-1-1** support (6) for the first fuel injector.
 5. Install the fuel injector screw (5) and tighten to 5 N.m (44 lb in).
 6. Repeat the same procedure for the remaining fuel injectors with **EN-51146-150** adapters and **EN-51146-1-1** supports still attached.
 7. Connect the fuel injector wiring harness plugs, if necessary.
2. Ensure the fuel rail assembly and fuel injector bores have been cleaned prior to installation.

Fig. 528: Fuel Rail Assembly

Courtesy of GENERAL MOTORS COMPANY

NOTE: During the installation of the fuel rail and injector assembly, ensure that the fuel injectors are positioned straight into the injector opening. Failure to follow this caution can tilt or bend the injectors and could cause leaks or malfunction after installation.

3. Carefully install the fuel rail assembly (1).
4. Push the fuel injectors slightly in their seats.

Fig. 529: Fuel Rail Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

5. Tighten the 4 lower fuel rail bolts in increments of 1 turn until they are seated.
6. Tighten the 4 lower fuel rail bolts in sequence to 10 N.m (89 lb in).
7. Tighten the 4 upper fuel rail bolts in sequence to 10 N.m (89 lb in).

IGNITION COIL INSTALLATION

Fig. 530: Ignition Coil

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Inspect the inside of the ignition coil rubber boot for a thin, even coat of grease. 2. If there is no grease present or additional grease is necessary, apply a thin coating of dielectric grease evenly to the inside of the ignition coil rubber boot, up to a depth of 15 mm from the end of the boot. Refer to Adhesives, Fluids, Lubricants, and Sealers. 3. Remove any excess grease from around the end of the boot, and ensure there is not an excessive amount within the boot.	
1	Ignition Coil Assembly (Qty: 4) CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)

WATER OUTLET INSTALLATION

Fig. 531: Water Outlet
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Water Outlet Gasket NOTE: Use a NEW gasket. Ensure the mating surfaces are clean and free of debris.
2	Water Outlet
3	Water Outlet Bolt (Qty: 2) CAUTION: Refer to <u>Fastener Caution</u> . Tighten 12 N.m (106 lb in)

ENGINE LIFT AND SIGHT SHIELD BRACKET INSTALLATION

Fig. 532: Engine Lift And Sight Shield Bracket
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Engine Lift Rear Bracket
2	Engine Lift Bracket Bolt (Qty: 2) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 25 N.m (18 lb ft)
3	Engine Lift Front Bracket
4	Engine Lift Bracket Bolt (Qty: 2) Tighten 25 N.m (18 lb ft)

FUEL PUMP INSTALLATION

Fig. 533: Fuel Pump

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Valve Lifter Follower NOTE: The camshaft must be in the base circle position before the high pressure fuel pump is installed. Procedure 1. Lubricate the valve lifter follower with engine oil, refer to Adhesives, Fluids, Lubricants, and Sealers.

Callout	Component Name
	NOTE: At the base circle position, the EN-51365 alignment gauge will sit flush with the cylinder head. 2. Install the valve lifter follower. Ensure that the guide pin on the follower is aligned with the groove in the fuel pump bore. Install EN-51365 alignment gauge and rotate the camshaft until the special tool is flush with the cylinder head. This indicates the camshaft lobe is at base circle position. 3. Remove EN-51365 alignment gauge and the valve lifter follower. 4. Lubricate the valve lifter follower again with engine oil. 5. Install the valve lifter follower. Ensure that the guide pin on the follower is aligned with the groove in the fuel pump bore. Special Tools EN-51365 Fuel Pump Installation Gauge For equivalent regional tools, refer to Special Tools.
2	Fuel Pump NOTE: If the fuel pump is not new, replace the fuel pump O-ring seal. Lubricate the O-ring with one drop of clean engine oil.
3	Fuel Pump Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-

Callout	Component Name
	<u>Yield</u> <u>Fastener</u> <u>Caution</u> . CAUTION: Alternately hand-tighten the fuel pump bolts one turn at a time until the pump is fully seated. Trying to draw down the pump without even side-to-side tightening may result in pump plunger damage. Procedure Install NEW fuel injection pump bolts alternating in steps of one turn each until seated to specified torque. Tighten 25 N.m (18 lb ft)
4	Fuel Pump Insulator WARNING: The noise cancelling foam component MUST be replaced if it has been exposed to engine fluids. Failure to replace the noise cancelling foam component that has been

Callout	Component Name
	exposed to engine fluids may result in an engine fire resulting in catastrophic engine damage, and possible injury or death.
5	Fuel Feed Intermediate Pipe NOTE: Use a NEW pipe. Procedure NOTE: Do not remove shipping caps from the fuel rail fitting or fuel pump fitting until installation of pipe. Do not remove the fuel pump inlet shipping cap at any time. 1. Remove any fuel pipe shipping caps, if applicable. 2. Finger start the fuel pipe nuts to pump and fuel rail. 3. Finger start the fuel feed intermediate pipe assembly bolt through the pipe bracket. 4. Snug the fuel pipe nut at the pump by hand, 5 full turns minimum. 5. Snug the fuel pipe nut at the fuel rail by hand, 5 full turns minimum. NOTE: Tightening the bracket bolt prior to final torque for the pipe

Callout	Component Name
	nuts helps to align the fuel feed pipe. 6. Tighten the fuel feed intermediate pipe assembly bracket bolt to 10 N.m (22 lb ft). 7. Torque the pipe nut to fuel rail to specification. 8. Torque the pipe nut to pump to specification. Tighten 30 N.m (22 lb ft)
6	Fuel Feed Intermediate Pipe Bolt (Qty: 1) Tighten 10 N.m (89 lb in)

INTAKE MANIFOLD INSTALLATION

Fig. 534: Intake Manifold With Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Intake Manifold Gasket NOTE: Use a NEW gasket. Ensure the mating

Callout	Component Name
	surfaces are clean and free of debris.
2	Intake Manifold
3	Intake Manifold Bolt (Qty: 5) CAUTION: Refer to Fastener Caution . NOTE: Bolt retainers keep the bolts in position on the assembly. Procedure: Tighten the bolts in sequence. Tighten 12 N.m (106 lb in)

THROTTLE BODY ASSEMBLY INSTALLATION

Fig. 535: Throttle Body Assembly

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Throttle Body Gasket NOTE: Use a NEW gasket. Ensure the mating surfaces are clean and free of debris.
2	Throttle Body
3	Throttle Body Bolt (Qty: 4) NOTE: Tighten the 4 bolts in a criss-cross

Callout	Component Name
	pattern. CAUTION: Refer to Fastener Caution . Tighten 10 N.m (89 lb in)

ENGINE WIRING HARNESS ASSEMBLY INSTALLATION

Fig. 536: Engine Wiring Harness Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Engine Wiring Harness
2	Engine Wiring Harness Bracket Bolt (Qty: 2) CAUTION: Refer to Fastener Caution . Tighten 25 N.m (18 lb ft)

Callout	Component Name
3	Wiring Harness Connector Bolt Tighten 10 N.m (89 lb in)

WATER PUMP INSTALLATION

Fig. 537: Water Pump
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Water Pump Housing Gasket NOTE: Use a NEW gasket. Ensure the mating surfaces are clean and free of debris.
2	Water Pump

Callout	Component Name
3	Water Pump Bolt CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 25 N.m (18 lb ft)
4	Water Pump Bolt (Qty: 2) Tighten 25 N.m (18 lb ft)
5	Thermostat Bypass Pipe Gasket
6	Water Pump Inlet Hose Fitting
7	Thermostat Bypass Pipe Bolt (Qty: 2) Tighten 10 N.m (89 lb in)

EXHAUST GAS RECIRCULATION VALVE INSTALLATION

Fig. 538: Exhaust Gas Recirculation Valve
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Exhaust Gas Recirculation Valve Gasket NOTE: Use a NEW Gasket.
2	Exhaust Gas Recirculation Valve
3	Exhaust Gas Recirculation Valve Bolt (Qty: 3) CAUTION: Refer to <u>Fastener</u> <u>Caution</u> . Tighten 10 N.m (89 lb in)
4	Exhaust Gas Recirculation Valve Cooling Return Hose Procedure 1. Inspect the hose, and replace if necessary. Connect the cooling return hose at the exhaust gas recirculation valve. 2. Connect the cooling return hose at the water pump inlet adapter.

EXHAUST GAS RECIRCULATION COOLER INSTALLATION

Fig. 539: Exhaust Gas Recirculation Cooler

6	Exhaust Gas Recirculation Pipe Bolt (Qty: 2) Tighten 10 N.m (89 lb in)

AUTOMATIC TRANSMISSION FLEX PLATE INSTALLATION

Fig. 542: Automatic Transmission Flex Plate With Bolt Tightening Sequence
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Crankshaft Position Sensor Reluctor Ring CAUTION: Refer to <u>Crankshaft</u>

Callout	Component Name
	Position Sensor Reluctor Ring Caution .
2	Automatic Transmission Flex Plate Procedure 1. Install the flex plate, and install the flex plate bolts hand tight to hold in place. 2. Remove the starter opening cover. Refer to Engine Block Disassemble. 3. Install EN-51760 holder to lock the flywheel via the starter ring gear. Special Tools EN-51760 Flywheel Holder Equivalent regional tools: Special Tools.
3	Automatic Transmission Flex Plate Bolt (Qty: 8) CAUTION: Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . NOTE: Bolts have adhesive patch and must be tightened to final torque within 5 minutes. Procedure Tighten the NEW flex plate bolts in the sequence shown. 1. Tighten the bolts a first pass to 20 N.m (15 lb ft). 2. Tighten the bolts a second pass to 30 N.m (22 lb ft). 3. Using the EN-45059 angle meter, tighten the bolt a final pass 70 degrees. 4. Remove EN-51760 holder once final torque is achieved.

Callout	Component Name
	5. Install the starter opening cover. Refer to Engine Block Assemble. Special Tools EN-45059 Angle Meter Equivalent regional tools: Special Tools.

CRANKSHAFT BALANCER INSTALLATION

Fig. 543: Crankshaft Balancer
 Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Remove the starter opening cover. Refer to Engine Block Disassemble. 2. Install EN-51760 holder, lock the automatic transmission flex plate via the starter ring gear. Special Tools EN-51760 Flywheel HolderFor equivalent regional tools, refer to Special Tools.	
1	Crankshaft Balancer Procedure: Using the screw, washer, bearing, and nut from the EN-51368 installer, seat the crankshaft balancer. Special Tools EN-51368 Front Crankshaft Seal Installer For equivalent regional tools, refer to Special Tools .
2	Crankshaft Balancer Bolt CAUTION:

Callout	Component Name
	Refer to Fastener Caution . CAUTION: Refer to Torque-to-Yield Fastener Caution . Procedure: Tighten the NEW crankshaft balancer bolt in the sequence shown. 1. Tighten the bolt a first pass to 100 N.m (74 lb ft). 2. Loosen the bolt 360 degrees. 3. Tighten the bolt a second pass to 100 N.m (74 lb ft). 4. Tighten the bolt a final pass 180 degrees using EN-45059 angle meter. 5. Install the starter opening cover. Refer to Engine Block Assemble. Special Tools EN-45059 Angle Meter For equivalent regional tools, refer to Special Tools.

OIL FILTER INSTALLATION

Fig. 544: Oil Filter, Fitting Adapter And Drain Plug

Callout	Component Name
1	Oil Pan Drain Plug CAUTION: Refer to Component Fastener Tightening Caution . NOTE: Use a NEW gasket. Tighten 25 N.m (18 lb ft)
2	Oil Filter Fitting Tighten 55 N.m (41 lb ft)
3	Oil Filter Tighten 3/4 to 1 full turn after gasket makes contact with the sealing surface on the filter mounting flange. Special Tools EN-726-A Oil Filter Wrench For equivalent regional tools, refer to Special Tools.

ENGINE PRELUBING

Special Tools

EN-45299 Engine Preluber

For equivalent regional tools, refer to [Special Tools](#).

Fig. 545: Oil Pressure Switch

Courtesy of GENERAL MOTORS COMPANY

NOTE: A constant and continuous flow of clean engine oil is required in order to properly prime the engine. Ensure an approved engine oil is used, as specified in the owners manual.

1. Remove the oil pressure switch.
2. Install the M12 x 1.75 adapter (1) P/N 509376.

Fig. 546: Flexible Hose, Adapter And Preluber
Courtesy of GENERAL MOTORS COMPANY

3. Install the flexible hose to the adapter and open the valve.
4. Pump the handle on the **EN-45299** preluber (1) in order to flow a minimum of 1 - 1.9 liters (1 - 2 quarts) of engine oil. Observe the flow of engine oil through the flexible hose and into the engine assembly.
5. Close the valve and remove the flexible hose and adapter from the engine.

CAUTION: Refer to [Fastener Caution](#) .

6. Install the oil pressure switch to the engine and tighten to 26 N.m (19 lb ft).
7. Top-off the engine oil to the proper level.

DESCRIPTION AND OPERATION

CRANKCASE VENTILATION SYSTEM DESCRIPTION

Positive Crankcase Ventilation System

The crankcase ventilation system is used to consume crankcase vapors in the combustion process instead of venting vapors to the atmosphere. Fresh air from the intake system is supplied to the crankcase and mixed with blow-by gases inside the crankcase. Blow-by gases rise to the top of the engine and are picked up into the oil separation chamber in the camshaft cover, where oil is separated from the gases. Blow-by gases are then passed to the intake

manifold to be consumed by normal combustion, through a calibrated orifice inside of the camshaft cover.

Operation

Fig. 547: Crankcase Ventilation System Diagram
Courtesy of GENERAL MOTORS COMPANY

Fresh air is brought into the engine through the positive crankcase ventilation (PCV) valve (4) as long as the crankcase is under vacuum. The primary control is through the PCV orifice (3) which meters the flow into intake manifold, at a rate depending on manifold vacuum. The PCV orifice is an integral part of the camshaft cover. Under certain operating conditions, the system is designed to allow excessive amounts of blow by gases to flow through the PCV valves (1 or 2) depending on if the engine is in boost mode or excessive crankcase pressure is detected and then routed into the intake system to be consumed by normal combustion.

Turbo Applications:

During normal operating conditions the PCV gases are routed using PCV valve (3) and the internal passage within the camshaft cover. When the Turbo is active, check valve (3) is closed and check valve (1) opens and PCV gases are routed back to the turbocharger to be consumed by normal combustion. If the engine sees excessive positive crankcase pressure check valve (2) opens and the pressure is routed to the air inlet to be reintroduced into the engine.

Non-Turbo Applications:

During normal operating conditions the PCV gases are routed using check valve (3) and the internal passage within the camshaft cover. If the engine sees excessive positive crankcase pressure check valve (2) opens and the pressure is

routed to the air inlet. Also for non-turbo applications check valve (1) does not exist.

In any application check valve (2) is only used if the engine sees excessive crankcase pressure.

Results of Incorrect Operation

A plugged orifice may cause the following conditions:

- Rough idle
- Stalling or slow idle speed
- Oil leaks
- Sludge in engine

A leaking orifice may cause the following conditions:

- Rough idle
- Stalling
- High idle speed

ENGINE COMPONENT DESCRIPTION

Engine Description

Cylinder Block

The cylinder block is constructed of aluminum alloy by high-pressure die casting with 4 cast-in-place iron cylinder liners arranged in-line. The block has 5 crankshaft bearings with the thrust bearing located on the second bearing from the rear of the engine. The cylinder block incorporates a bedplate design that forms an upper and lower crankcase. This design promotes cylinder block rigidity and reduced noise and vibration.

Crankshaft

The crankshaft is forged micro alloy steel. It is supported in 5 main journals with main bearings which have oil clearance for lubricating. The thrust bearing is located in the 4th position which controls proper crankshaft axial end play. The crankshaft is also comprised of 8 counterweights that have been scalloped for mass reduction and topped for precise engine balance. A harmonic balancer is used to control torsional vibration.

Piston and Connecting Rod

The pistons are cast aluminum. The pistons use 2 compression rings and 1 oil control ring assembly. The piston is a low friction, lightweight design with a recessed top and barrel shaped skirt. The piston pins are chromium steel and are a full-floating design. The connecting rods are powdered metal. The connecting rods are fractured at the connecting rod journal and then machined for the proper clearance. All applications use a piston with a graphite coated skirt. The piston and pin are to be serviced as an assembly.

Upper Oil Pan

The oil pan is a structural aluminum oil pan with transmission attachment. It includes the oil suction pipe, this pipe is connected with the oil pump. The oil pan is attached at the lower crankcase.

Oil Pump

The oil pump is a crankshaft driven oil pump integrated in pump module. The oil pump draws engine oil from the oil pan and feeds it under pressure to the various parts of the engine. An oil strainer is mounted before the inlet of the oil pump to remove impurities which could clog or damage the oil pump or other engine components. When the

crankshaft rotates, the oil pump driven gear rotates. This causes the space between the gears to constantly open and narrow, pulling oil in from the oil pan when the space opens and pumping the oil out to the engine as it narrows. At high engine speeds, the oil pump supplies a much higher amount of oil than required for lubrication of the engine. The oil pressure regulator prevents too much oil from entering the engine lubrication passages.

Cylinder Head

This cylinder head is double over head camshaft (DOHC) type and has 2 camshafts that open 4 valves per cylinder with hydraulic valve lash adjuster. The camshaft sprocket wheels are installed in front of the camshafts. The cylinder head is made of cast aluminum alloy for better strength in hardness with light weight. The combustion chamber of the cylinder head is designed for increasing of squish and swirl efficiency and then this is maximized to gasoline combustion efficiency. The exhaust manifold is integrated into the cylinder head.

Valves

There are 2 intake and 2 exhaust valves per cylinder. Positive valve stem seals are used on all valves.

Valve Lash Adjusters

The valve train uses a roller finger follower acted on by a hydraulic lash adjuster. The roller finger follower reduces friction and noise.

Camshaft Cover

The camshaft cover has a steel crankcase ventilation baffling incorporated. The camshaft cover has mounting locations for the ignition system.

Camshaft/Camshaft Drive

Two camshafts are used, one for all intake valves, the other for all exhaust valves. The camshafts are assembled with steel lobes.

This engine design uses a chain to drive the dual overhead camshafts. The chain is an inverted tooth or silent design with a 6.35 mm pitch to ensure quiet operation and is hydraulically tensioned to be maintenance-free. The tensioner has a ratchet mechanism to reduce chain movement during engine starts to eliminate noise. The lightweight plastic/composite chain guides have a unique grooved face design to reduce friction for optimum efficiency. Both the crank sprocket and cam sprockets are hardened to prevent wear even with extended oil change intervals.

Intake Manifold

The intake manifold is the air flow passage to the cylinder combustion chamber through the throttle body and has an effect on engine torque, power, noise, driveability, emission, fuel economy and performance. It is made of composite plastic. The intake manifold incorporates a distribution and control system for positive crankcase ventilation (PCV) gases.

Turbocharger, If Equipped

The turbocharger consists of turbine and compressor on a common shaft. The shaft bearing is constructed to higher rotation speed and lubricated by engine oil. The turbocharger is water cooled for improved durability. The turbine wheel is driven by exhaust emissions. The compressor wheel compresses the intake air. A wastegate bypass valve regulates the charging pressure for generating a high pressure at low speed as well. At a defined charging pressure it regulates the way of the exhaust emission on bypassing the turbine wheel. The wastegate valve is controlled pneumatic and electric from the pressure in the intake manifold. The pressure of exhaust emission is reduced by opening the wastegate thereby reducing the intake pressure.

Fuel Injection System

The engine is equipped with a central direct injection system. The fuel system consists of 4 separate direct injection fuel injectors, one high pressure fuel rail, and a high pressure fuel feed pipe that connects the high pressure fuel pump to the fuel rail. The injectors are each seated into their individual bores in the cylinder head with two combustion seals to provide sealing. The high pressure fuel pump mounts to the rear of the cylinder head and is driven by the intake camshaft. Motion is transmitted to the pump from a tri-lobe on the rear of the camshaft through a hydraulic roller lifter. Due to the location of the central direct injection system injector location this provides an increase in fuel economy and performance.

SEPARATING PARTS

NOTE:

- **Disassembly of the piston, press fit design piston pin, and connecting rod may create scoring or damage to the piston pin and piston pin bore. If the piston, pin, and connecting rod have been disassembled, replace the components as an assembly.**
- **Many internal engine components will develop specific wear patterns on their friction surfaces.**
- **When disassembling the engine, internal components MUST be separated, marked, or organized in a way to ensure installation to their original location and position.**

Separate, mark, or organize the following components:

- Piston and the piston pin
- Piston to the specific cylinder bore
- Piston rings to the piston
- Connecting rod to the crankshaft journal
- Connecting rod to the bearing cap

A paint stick or etching/engraving type tool are recommended. Stamping the connecting rod or cap near the bearing bore may affect component geometry.

- Crankshaft main and connecting rod bearings
- Camshaft and valve lash adjusters
- Valve lash adjusters, lash adjuster guides, pushrods and rocker arm assemblies
- Valve to the valve guide
- Valve spring and shim to the cylinder head location
- Engine block main bearing cap location and direction
- Oil pump drive and driven gears

LUBRICATION DESCRIPTION

Fig. 548: Cutaway View Of Lubrication System
Courtesy of GENERAL MOTORS COMPANY

Engine lubrication is supplied by a variable displacement two-stage vane-type oil pump assembly. An oil control solenoid valve, controlled by the engine control module (ECM), mounted to the oil pump provides two stage functionality. The oil pump is mounted off-axis on the front of the engine.

All oil passing through the oil pump goes through the oil filter, where contaminants are removed. The oil filter is located on the left front side of the engine block. The oil filter is a spin-on type that mounts directly to the engine block. A bypass valve is incorporated into the oil filter, which permits oil flow in the event the filter becomes restricted.

Oil then enters the gallery where it is distributed to the crankshaft, piston oil nozzles, and timing chain oil nozzle. For turbo applications, oil is also distributed through the turbocharger oil feed and return pipes (3) and engine oil cooler. The connecting rod bearings are oiled by passages through the crankshaft connecting the main journals to the rod journals. A groove around each upper main bearing furnishes oil to the drilled crankshaft passages. The pressurized oil passes through the cylinder head restrictor orifice into the cylinder head and then into each camshaft feed gallery. Passages feed each hydraulic lash adjuster.

The front feed off the main oil gallery also feeds the timing chain tensioner (1) and the intake and exhaust side phasers and oil control valves.

NOTE: **A mechanical vacuum pump is not used on hybrid engine.**

On the exhaust side, drilled passages feed each camshaft journal surface and the exhaust side head gallery feeds the mechanical vacuum pump. On the intake side, the oil is fed through the hollow camshaft to each camshaft journal surface, and a separate connected gallery feeds the intake side hydraulic lash adjusters.

An engine oil pressure sensor (2) is located on the intake rear side of the engine just below the head gasket interface. Oil returns to the oil pan through passages cast into the cylinder head. The phasers and timing chain drive lubrication drains directly into the oil pan behind the front cover.

CLEANLINESS AND CARE

An automobile engine is a combination of many machined, honed, polished, and lapped surfaces with tolerances that are measured in ten thousandths of an inch. When any internal engine parts are serviced, care and cleanliness are important. A liberal coating of engine oil should be applied to friction areas during assembly to protect and lubricate the surfaces during initial operation. Throughout this section, it should be understood that proper cleaning and protection of machined surfaces and friction areas are part of the repair procedure. This is considered standard shop practice even if not specifically stated.

When valve train components are removed for service, they should be retained in order. At the time of installation, they should be installed in the same locations and with the same mating surfaces as when removed.

REPLACING ENGINE GASKETS

Special Tools

J 28410 Gasket Remover

For equivalent regional tools, refer to [Special Tools](#).

Gasket Use and Applying Sealants

- Do not use any gasket again unless specified.
- Gaskets that can be used again will be identified in the service procedure.
- Do not apply sealant to any gasket or sealing surface unless called out in the service information.

Separating Components

- Use a rubber mallet to separate components.
- Bump the part sideways to loosen the components.
- Bumping should be done at bends or reinforced areas to prevent distortion of parts.

Cleaning Gasket Surfaces

- Remove all gasket and sealing material from the part using the **J 28410** remover or equivalent.
- Care must be used to avoid gouging or scraping the sealing surfaces.
- Do not use any other method or technique to remove sealant or gasket material from a part.
- Do not use abrasive pads, sand paper, or power tools to clean the gasket surfaces.
 - These methods of cleaning can cause damage to the component sealing surfaces.
 - Abrasive pads also produce a fine grit that the oil filter cannot remove from the oil.
 - This grit is abrasive and has been known to cause internal engine damage.

Assembling Components

CAUTION: Refer to [Sealant Caution](#) .

- When assembling components, use only the sealant specified or equivalent in the service procedure.
- Sealing surfaces should be clean and free of debris or oil.
- Specific components such as crankshaft oil seals or valve stem oil seals may require lubrication during assembly.
- Components requiring lubrication will be identified in the service procedure.
- When applying sealant to a component, apply the amount specified in the service procedure.
- Tighten bolts to specifications. Do not overtighten.

USE OF ROOM TEMPERATURE VULCANIZING (RTV) AND ANAEROBIC SEALANT

Cleaning Mating Part Surfaces for RTV Joints

RTV sealant depends greatly on adhesion to the mating parts in order to form and maintain a robust sealed joint. As with any adhesion system, proper surface preparation of the bonded parts is extremely important to ensure good adhesion over the life of the product.

CAUTION: When cleaning the sealing surfaces of engine components, **DO NOT** use bristle discs, abrasive pads, wire wheels or surface conditioning discs. These types of devices should not be used because they produce a very fine grit that is abrasive and known to cause internal engine damage. The bristle discs and pads are embedded with abrasive material and wear down as they clean, continually exposing fresh abrasive to the surface of the component.

Abrasive pads, wire wheels and bristle discs can remove enough metal to affect the engine front cover, cylinder head, engine block, oil pan rail, and intake manifold runner surface flatness, which can then result in engine coolant leaks, engine oil leaks and air leaks. It takes about 15 seconds to remove 0.203 mm (0.008 in) of metal with an abrasive pad.

Abrasive pads, wire wheels and bristle discs used with high speed grinders produce airborne debris that can travel throughout the shop contaminating other work being performed outside of the immediate work area.

When cleaning engine gasket sealing surfaces and/or cleaning parts from an engine that are to be reused, surface conditioning discs, typically constructed of woven fiber or molded bristles that contain abrasives, such as a high amount of aluminum oxide, should NOT be used. The use of such surface conditioning discs dislodges aluminum oxide from the disk and metal component particles, which can lead to premature engine bearing failure. The presence of aluminum oxide in engine oil has been shown to cause premature engine bearing failure. In some cases, this failure occurs in as little as 1,600 km (1,000 mi) or less after the repair has been made.

Surface conditioning discs may grind the component material and embed it into the disc. This can result when more aggressive grinding of the gasket surface takes place.

General Motors strongly recommends using a plastic razor blade, plastic gasket scraper, a wood scraper or a non-metallic scraper to remove all sealer/gasket material on the surface of engine components that are to be reused. Do not use any other method or technique to remove the sealant or the gasket material from a part.

- Do not gouge or scratch any engine sealing surface during the cleaning process.
- It is not necessary to remove every speck of the old sealer.

To remove the old RTV sealant from the sealing surface, spray GM Low VOC Cleaner or an equivalent, on the mating surfaces and allow it to soak to loosen the old gasket material. Use care to avoid getting GM Low VOC Cleaner in any area other than the mating surface to be cleaned.

Use a plastic razor blade, that mounts in a scraper device or a hand held plastic razor blade, to remove old RTV

sealant from a sealing surface. Use a new blade for each corresponding engine component surface. Hold the blade as parallel to the flat surface as possible.

To properly clean the sealing surfaces prior to reassembly, spray GM Low VOC Cleaner on a folded lint free shop cloth. Wipe the mating surfaces on the engine and front cover and rotate the shop cloth until there are no more visible signs of contamination on the cloth.

After the final cleaning of the parts, allow up to 5 minutes for the components to dry before applying new RTV sealant.

NOTE: After the final cleaning with GM Low VOC Cleaner and before reassembly, DO NOT touch the cleaned surfaces with your hand. Oils from your skin WILL CONTAMINATE the surface and prevent proper bonding of the new RTV sealant.

Typical Applications

This procedure is intended for use in the following operations:

- Building of engines in a manual low volume build process where the use of assembly lubricants and other typical conditions exist which may contaminate the component sealing surfaces in an RTV joint.
- Cleaning of surfaces contaminated with oil or other substance during the assembly operation as a special case event.

In the typical situation, both the part being assembled, and the assembly to which it is to be sealed will be cleaned. An example is an oil pan assembled to a block/front cover/rear cover assembly using an RTV seal applied to the pan or the block. Both the pan and the block assembly should be cleaned prior to RTV application.

Any loose gaskets that are part of the RTV joint should not be cleaned unless it is known that they have been contaminated during the build process. Examples of loose gaskets are intake side and end seals which contact RTV used to seal a T-joint.

Assemblies supplied to GM with gaskets in place should not be cleaned unless they are known to be contaminated during the build process. Examples are rocker/cam covers with press in place gaskets using RTV at corners or T-joints.

Materials Needed

Use clean dry lint free cloths to wipe surface with approved solvent based cleaner. Examples are:

- GM Good Wrench Service Low VOC Brake Parts Cleaner
- AC Delco Non-Chlorinated Brake Parts Cleaner
- Loctite ODC - Free Cleaner & Degreaser

Procedure:

1. Identify the surfaces to which the RTV will come into contact in the assembled joint.
2. Using an approved solvent based cleaner, thoroughly soak an appropriate portion of a clean, dry cloth. Immediately wipe the surfaces with the cloth to remove any residue of oil, soap, etc.
3. Repeat step 2 using a clean portion of the cloth as many times as required until the cleanliness of the cloth after wiping the surface becomes constant in appearance. There is typically some discoloration of the cloth after wiping however a clean surface should produce the same level of discoloration with successive wiping with a clean cloth and solvent.
4. If crevices exist in the joint such that wiping the surface would not be sufficient to clean the crevice, the approved solvent based cleaner should be directly sprayed on the joint to ensure wetting of the surfaces and

removal of the contaminant. DO NOT spray rubber components directly. Care must be used to avoid getting solvent in areas other than necessary to clean the joint. Then continue with step 3.

5. Allow the surfaces to dry for a minimum of 1 minute or longer if necessary for the solvent to evaporate from the surface.
6. Do not touch the cleaned surface with anything prior to RTV application.
7. The surface is now prepared for RTV application.

Sealant Types

NOTE: The correct sealant and amount of sealant must be used in the proper location to prevent oil leaks, coolant leaks, or the loosening of the fasteners. DO NOT interchange the sealants. Use only the sealant, or equivalent, as specified in the service procedure.

The following two major types of sealant are commonly used in engines:

- Room Temperature Vulcanizing (RTV)
- Anaerobic sealant, which include the following:
 - Gasket Eliminator
 - Pipe Sealant
 - Threadlock

Room Temperature Vulcanizing (RTV) Sealer

This type of sealant is used where two components, such as the intake manifold and the engine block, are assembled together.

Use the following information when using RTV sealant:

- Do not use RTV sealant in areas where extreme temperatures are expected. These areas include:
 - The exhaust manifold
 - The head gasket
 - Any other surfaces where a different type of sealant is specified in the service procedure
- Do not use RTV sealant unless the ambient air temperature is at least 18°C (65°F) degrees or higher.
- Always follow all the safety recommendations and the directions that are on the RTV sealant container.
- Use a plastic or wood scraper in order to remove all the RTV sealant from the components.

CAUTION: Do not allow the RTV sealant to enter any blind threaded hole. RTV sealant that is allowed to enter a blind threaded hole can cause hydraulic lock of the fastener when the fastener is tightened. Hydraulic lock of a fastener can lead to damage to the fastener and/or the components. Hydraulic lock of a fastener can also prevent the proper clamping loads to be obtained when the fastener is tightened. Improper clamping loads can prevent proper sealing of the components allowing leakage to occur. Preventing proper fastener tightening can allow the components to loosen or separate leading to extensive engine damage.

- The surfaces to be sealed must be clean and dry.

NOTE: The bead size is critical and is easier to maintain consistency and application

with a RTV dispensing tool. This also helps to eliminate waste.

- Use a RTV sealant bead size as specified in the service procedure.
- Apply the RTV sealant bead to the inside of any bolt holes areas.

NOTE: Do not wait for the RTV sealant to skin over.

- Assemble the components while the RTV sealant is still wet to the touch, within 10 minutes.

NOTE: Do not overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the proper torque specifications.

Anaerobic Type Gasket Eliminator Sealant

Anaerobic type gasket eliminator sealant cures in the absence of air. This type of sealant is used where two rigid parts, such as castings, are assembled together. When two rigid parts are disassembled and no sealant or gasket is readily noticeable, then the two parts were probably assembled using an anaerobic type gasket eliminator sealant.

Use the following information when using gasket eliminator sealant:

- Always follow all the safety recommendations and directions that are on the gasket eliminator sealant container.
- Apply a continuous bead of gasket eliminator sealant to one flange.
- The surfaces to be sealed must be clean and dry.

CAUTION: Do not allow the sealant to enter a blind hole. The sealant may prevent the fastener from achieving proper clamp load, cause component damage when the fastener is tightened, or lead to component failure.

- Do not allow the gasket eliminator sealed joint to cure more than 5 minutes before torquing to specification. This will result in an incorrect clamp load of assembled components.
- Do not overtighten the fasteners.
 - Apply the gasket eliminator sealant evenly to get a uniform thickness of the gasket eliminator sealant on the sealing surface.
 - Tighten the fasteners in sequence, if specified, and to the proper torque specifications.
 - After properly tightening the fasteners, remove the excess gasket eliminator sealant from the outside of the joint.

Anaerobic Type Threadlock Sealant

Anaerobic type threadlock sealant cures in the absence of air. This type of sealant is used for threadlocking and sealing of bolts, fittings, nuts, and studs. This type of sealant cures only when confined between two close fitting metal surfaces.

Use the following information when using threadlock sealant:

- Always follow all safety recommendations and directions that are on the threadlock sealant container.
- The threaded surfaces to be sealed must be clean and dry.
- Apply the threadlock sealant as specified on the threadlock sealant container.

NOTE:

- Do not allow the threadlock sealant to cure more than 5 minutes before torquing to specification. This will result in an incorrect clamp load of assembled components.
- Do not overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the proper torque specifications.

Anaerobic Type Pipe Sealant

Anaerobic type pipe sealant cures in the absence of air and remains pliable when cured. This type of sealant is used where two parts are assembled together and require a leak proof joint.

Use the following information when using pipe sealant:

- Do not use pipe sealant in areas where extreme temperatures are expected. These areas include:
 - The exhaust manifold
 - The head gasket
 - Surfaces where a different sealant is specified
- Always follow all the safety recommendations and the directions that are on the pipe sealant container.
- The surfaces to be sealed must be clean and dry.
- Use a pipe sealant bead of the size or quantity as specified in the service procedure.

CAUTION: Do not allow the sealant to enter a blind hole. The sealant may prevent the fastener from achieving proper clamp load, cause component damage when the fastener is tightened, or lead to component failure.

- Apply the pipe sealant bead to the inside of any bolt hole areas.
- Apply a continuous bead of pipe sealant to one sealing surface.

NOTE:

Do not overtighten the fasteners.

- Tighten the fasteners in sequence, if specified, and to the proper torque specifications.

SPECIAL TOOLS AND EQUIPMENT**SPECIAL TOOLS**

Illustration	Tool Number/Description

Illustration	Tool Number/Description
 The illustration shows two identical blue cylindrical guide pins. Each pin has a main body with two distinct, slightly wider sections in the middle, creating a three-part appearance. They are positioned diagonally, with one pin slightly above and to the right of the other.	CH-51034 Cradle Alignment Guide Pins

Illustration	Tool Number/Description
 A 3D CAD illustration of fuel injector seal components. It includes a large cylindrical seal with a flange, a smaller cylindrical seal, and two long, thin cylindrical pins. The components are shown in a disassembled state, with the large seal at the top left, the smaller seal at the bottom left, and the two pins at the bottom right.	EN-49245 Fuel Injector Seal Installer/Sizer

	EN-49941 Piston Pin Clip Remover/Installer

Illustration	Tool Number/Description
 An exploded view diagram of a valve spring compressor tool assembly. The components are shown in a light blue color. On the left are two long, thin rods. In the center is a vertical assembly consisting of a long threaded rod with a handle at the top, a central body with a threaded section, and a base. To the right of this central assembly is a small, cylindrical component. Below the central assembly are two large, L-shaped metal plates with multiple holes. A series of small, cylindrical components are arranged vertically between the central assembly and the L-shaped plates.	EN-50717 Valve Spring Compressor - Head On

Illustration	Tool Number/Description
 The illustration shows two identical blue cylindrical components, which are injector seal installers. They are positioned diagonally, one below the other, against a white background. Each cylinder has a slightly flared end, suggesting a tapered design for installation.	EN-51105 Injector Seal Installer Adapters

Illustration	Tool Number/Description
 The diagram illustrates the components of the EN-51146 Injector Remover/Installer. The main assembly consists of a base plate with six vertical support rods. Two long vertical rods are positioned on the base plate, each topped with a cylindrical handle. To the left of the main assembly, various components are shown in an exploded view, including two sets of six small pins, four larger pins, two long rods, two short rods, and a set of four small pins with a bracket. The entire assembly is rendered in a light blue color.	EN-51146 Injector Remover/Installer

SPECIFICATIONS

FASTENER SPECIFICATIONS

Single Use Non-Threaded Fasteners/Components

NOTE: <i>All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.</i>	
Application	
Catalytic Converter Gasket	
Exhaust Front Pipe Gasket	
Exhaust Hanger Insulator	
Intermediate Exhaust Hanger Insulator	
Rear Exhaust Hanger Insulator	

Single Use Threaded Fastener/Component Tightening Specifications

NOTE: <i>All fasteners/components listed in this table MUST BE DISCARDED and replaced with NEW after removal.</i>	
Application	Specification
	Metric (English)
Catalytic Converter Nut	22 N.m (16 lb ft)

Reusable Threaded Fastener Tightening Specifications

NOTE: <i>All fasteners listed in this table can be reused after removal.</i>	
Application	Specification

	Metric (English)
Catalytic Converter Brace Bracket Bolt	22 N.m (16 lb ft)
Catalytic Converter Brace Bracket Nut	22 N.m (16 lb ft)
Catalytic Converter Bracket Nut	22 N.m (16 lb ft)
Catalytic Converter Heat Shield Bolt	9 N.m (80 lb in)
Catalytic Converter Rear Heat Shield Bolt	9 N.m (80 lb in)
Exhaust Front Pipe Nut	22 N.m (16 lb ft)
Exhaust Muffler Insulator Bolt	22 N.m (16 lb ft)
Exhaust Pipe Clamp	55 N.m (41 lb ft)
Rear Body Exhaust Heat Shield Nut	3 N.m (27 lb in)
Underbody Front Air Deflector Nut	3 N.m (27 lb in)

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - ENGINE EXHAUST

- Review the Exhaust System Description and Operation in order to familiarize yourself with the system functions. Refer to [Exhaust System Description](#).
- All diagnostics on a vehicle should follow a logical process. Strategy Based Diagnostics is a uniform approach for repairing all systems. The diagnostic flow is the place to start when repairs are necessary and may always be used in order to resolve a system problem.

Visual/Physical Inspection

- Inspect for aftermarket or non-OEM devices such as, but not including; tailpipe extensions, headers, and exhaust cutouts. This could affect the operation and proper performance of the exhaust system.
- Verify the exact operating conditions under which the concern exists. Note factors such as engine RPM, engine temperature, engine load, and frequency of concern.
- Inspect the easily accessible or visible system components for obvious damage or conditions, which could cause any symptom.

Intermittents

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating as designed.

Symptom List

- Loss of power - Refer to [Restricted Exhaust](#).
- Poor acceleration - Refer to [Restricted Exhaust](#).
- Poor fuel economy - Refer to [Restricted Exhaust](#).
- Excessive smoke-diesel - Refer to [Restricted Exhaust](#).
- Exhaust hissing noise - Refer to [Exhaust Leakage](#).
- Exhaust popping noise - Refer to [Exhaust Leakage](#).
- Exhaust rattle noise - Refer to [Exhaust Noise](#).

- Loud Exhaust noise - Refer to [Exhaust Noise](#).
- Exhaust buzz, groan, hum noise - Refer to [Exhaust Noise](#).

RESTRICTED EXHAUST

Diagnostic Aids

A quick check of exhaust flow will help determine for gasoline engines.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3

The exhaust system has very low back pressure under normal conditions. If the exhaust system is restricted, a significant increase in the exhaust pressure is noticed on the exhaust back pressure gauge.

Removing the heated oxygen sensor may set a DTC. When finishing this diagnostic table, be sure to clear all codes.

4

This step will isolate the catalytic converter from the remainder of the exhaust system.

7

Confirming that the condition has been fixed is essential. If the symptom still exists and the vehicle has a dual exhaust system, proceed to Step 2 and repeat diagnostic procedure on the opposite exhaust pipe.

Step	Action	Value(s)	Yes	No
1	Did you verify the customers complaint?	-	Go to Step 2	-
2	Did you review the exhaust symptoms diagnostic information and perform the necessary inspections?	-	Go to Step 3	Go to Symptoms - Engine Exhaust
